T 1		(Beijing, China)	Abstract
Issued:			A <i>rare-earth</i> permanent magnetic powder, a bonded <i>magnet</i> , and a device comprising the bonded <i>magnet</i> are provided. The <i>rare-earth</i> permanent
January 26, 2016			magnetic powder is mainly composed of 7-12 at % of Sm, 0.1-1.5 at % of M,
2010			10-15 at % of N, 0.1-1.5 at % of Si, and Fe as the balance, wherein M is at
Expires:			least one element selected from the group of Be, Cr, Al, Ti, Ga, Nb, Zr, Ta,
March			Mo, and V, and the main phase of the <i>rare-earth</i> permanent magnetic powder
2031			is of TbCu.sub.7 structure. Element Si is added into the <i>rare-earth</i> permanent
			magnetic powder for increasing the ability of SmFe alloy to from amorphous
			structure, and for increasing the wettability of the alloy liquid together with the
			addition of element M in a certain content, which enables the alloy liquid
			prone to be injected out of a melting device. The average diameter of the <i>rare-</i> earth permanent magnetic powder is in the range of 10-100 .mu.m, and the
			rare-earth permanent magnetic powder is composed of nanometer crystals
			with average grain size of 10-120 nm or amorphous structure.
			What we claim is:
			1. A rare-earth permanent magnetic powder, wherein the rare-earth permanent

			magnetic powder consists essentially [presumptive composition of matter] of 7.about.12 at % 0 of Sm, Fe, M, 0.1.about.1.5 at % Si and 5.about.20 at % of N, Fe is as the balance, M consists essentially of 0.1.about.3 at % of Zr and 0.1.about.1.5 at % of R, wherein R is selected from the group consisting of Be, Cr, Al, Ti, Ga, Nb, Ta, Mo, and V, part of element Sm in the rare-earth permanent magnetic powder is replaced by other rare-earth elements and the other rare-earth accounts for 0.about.10 at %, part of element Fe in the rare-earth permanent magnetic powder is replaced by element Co and Co accounts for 0.about.30 at %, and at least 80 vol % of the rare-earth permanent magnetic powder is TbCu.sub.7 phase, and wherein the atomic ratio of R to Zr is in the range of 0.05.about.0.5.
Filed: September 10, 2010  Issued: January 26, 2016  Expires: September 2030	9,242,296	Assignee: KABUSHIKI KAISHA TOYOTA CHUO KENKYUSHO (Nagakute, Japan)	Abstract  A method for producing a rare earth magnet material which allows efficient Dy or the like diffusion into an inside thereof. This method includes a preparation step of preparing a powder mixture of magnet powder including one or more rare earth elements including neodymium, boron, and the remainder being iron; and neodymium fluoride powder; a heating step of heating a compact of the powder mixture and causing oxygen around magnet powder particles to react with the fluoride powder, thereby obtaining a lump rare earth magnet material in which neodymium oxyfluoride is wholly distributed. The fluoride powder traps oxygen enclosed in the powder mixture and fixes the oxygen as stable NdOF. When Dy is diffused into this rare earth magnet material, Dy smoothly enters into its inside without being oxidized at grain boundaries. Consequently, coercivity of the entire rare earth magnet material can be efficiently increased without wasting scarce Dy

			The invention claimed is:
			1. A method for producing a rare earth magnet material, [presumptive process/method]:comprising: a preparation step of preparing a powder mixture of: magnet powder being powder of a magnet alloy comprising a first rare earth element (hereinafter referred to as "R1") which is one or more rare earth elements, boron (B), and the remainder being iron (Fe) and inevitable impurities with or without a reforming element; and fluoride powder being powder of a fluoride, at least one of the magnet powder and the fluoride powder containing neodymium (Nd); a heating step of heating a compact of the powder mixture, thereby obtaining a lump rare earth magnet material in which neodymium oxyfluoride which is a reaction product of oxygen or an oxide in the vicinity of particles of the magnet powder and the fluoride is distributed over all parts including not only a surface part but also an inner part thereof; and a diffusing step of diffusing a diffusing element comprising a third rare earth element (hereinafter referred to as "R3") which is one or more rare earth elements, from a surface to the inner part of the rare earth magnet material, wherein the diffusing element is dysprosium (Dy) or terbium (Tb), a ratio of fluoride powder to be mixed in the magnet powder relative to 100 atomic % of the total powder mixture is 0.1 to 10 atomic %, and the preparing step comprises adjusting the amount of the fluoride powder to be mixed in the powder mixture in accordance with an estimated amount of oxygen atoms to be contained in the rare earth magnet material

--------	------

manufacturing a bonded magnet using magnetic powder and a bonded magnet manufactured thereby. Further, a method of preparing R--Fe--B-based rare earth magnetic powder having improved magnetic properties including grinding rare earth sintered magnet products as a raw material, performing a hydrogenation process where a ground product is charged into a furnace, and the furnace is then filled with hydrogen and a temperature of the furnace is increased, performing a disproportionation process where the temperature of the furnace is further increased in the same hydrogen atmosphere above, performing a desorption process where hydrogen is exhausted from an inside of the furnace, and performing a recombination process where hydrogen in the inside of the furnace is exhausted, and magnetic powder prepared thereby, and a method of manufacturing a bonded magnet.

## The invention claimed is:

- 1. A method of preparing [presumptive process/method] R--Fe--B-based rare earth magnetic powder having improved magnetic properties, the method comprising: coarse grinding rare earth sintered magnet products as a raw material; performing a hydrogenation process in which a ground product obtained through the coarse grinding is charged into a tube furnace, and the tube furnace is then filled with hydrogen and a temperature of the tube furnace is increased; performing a disproportionation process in which the temperature of the tube furnace is further increased in the same hydrogen atmosphere as that of the hydrogenation process; performing a desorption process in which hydrogen is exhausted from an inside of the tube furnace; and performing a recombination process in which hydrogen in the inside of the tube furnace is vacuum exhausted after the desorption process is performed, wherein the recombination process is performed after the desorption process and the disproportionation process and desorption process are repeated one time.
- 2. **The method** as set forth in claim 1, wherein the rare earth sintered magnet

			products, are process scraps generated during manufacturing processes of rare earth magnets and RFeB-based rare earth sintered magnet products recovered from defective products or wasted products.

Expires:			RE alloy powders comprising a RE element.
January 2033			The invention claimed is:
			1. A mixture of powders [presumptive composition of matter], for preparing a sintered nickel-titanium-rare earth (NiTiRE) alloy, the mixture comprising: NiTi alloy powders comprising from about 55 wt. % Ni to about 61 wt. % Ni and from about 39 wt. % Ti to about 45 wt. % Ti and comprising a mixture of first and second binary alloy powders of different weight percentages of Ni and Ti; and RE alloy powders comprising a RE element.
			2. The mixture of claim 1, wherein the first binary alloy powders comprise about 56 wt. % Ni and about 44 wt. % Ti and the second binary alloy powders comprise about 60 wt. % Ni and about 40 wt. % Ti.
			3. The mixture of claim 1, wherein a weight ratio of the first binary alloy powders to the second binary alloy powders is from about 70:30 to about

30:70.

- 4. The mixture of claim 3, wherein a weight ratio of the first binary alloy powders to the second binary alloy powders is about 40:60 to about 50:50.
- 5. The mixture of claim 1, wherein the RE alloy powders comprise at least one additional element.
- 6. The mixture of claim 5, wherein the at least one additional element is a dopant element or an additional alloying element selected from the group consisting of: B, Al, Cr, Mn, Fe, Ni, Co, Cu, Zn, Ga, Ge, Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Hf, Ta, W, Re, Os, Ir, Pt, Au, Hg, TI, Pb, Bi, Po, V, other rare earth elements, and Y.
- 16. **A method** of forming a sintered nickel-titanium-rare earth (Ni--Ti--RE) alloy, the method including: adding Ni--Ti alloy powders and RE alloy powders to a powder consolidation unit including an electrically conductive die and punch connectable to a power supply, the Ni--Ti alloy powders including from about 55 wt. % Ni to about 61 wt. % Ni and from about 39 wt. % Ti to about 45 wt. % Ti and comprising a mixture of first and second binary alloy powders of different weight percentages of Ni and Ti, the RE alloy powders including a RE element; heating the powders to a sintering temperature of from about 730.degree. C. to about 840.degree. C.; applying a pressure of from about 60 MPa to about 100 MPa to the powders at the sintering temperature; and forming a sintered Ni--Ti--RE alloy. 20. The method of claim 16, further including hot working the sintered Ni--Ti--RE alloy at a temperature of at least about 730.degree. C. to form a hot worked Ni--Ti--RE alloy component, and further including cold drawing the hot worked Ni--Ti--RE alloy component to form a Ni--Ti--RE alloy wire having a diameter of about 2 mm or less.

Expires:			R.sub.2T.sub.14B (R represents at least one <i>rare earth</i> element of Nd, Pr or
May 2032			both and T represents at least one transition metal element including Fe or Fe
			and Co) compound and a grain boundary phase containing a higher proportion
			of R than the main phase, wherein the main phase includes a heavy <i>rare earth</i> element (one of Dy, Tb or both), at least part of main phase grains of the main
			phase included in the sintered <i>rare earth magnet</i> includes at least the
			following regions, low, high and intermediate concentration regions. These
			regions exist in order of low, high, and intermediate concentration regions,
			from low concentration region towards the grain boundary phase in the main
			phase grains.

The invention claimed is:

1. A sintered rare earth magnet, comprising : [presumptive composition of matter] a main phase composed of R.sub.2T.sub.14B, where: R comprises as a main component one or more rare earth element selected from: Nd, Pr, and Nd and Pr, and T represents one or more transition metal element selected from: Fe, and Fe and Co; and a grain boundary phase containing a higher proportion of R than the main phase; wherein: the main phase includes one or more heavy rare earth element selected from: Dy, Tb, and Dy and Tb; at least a part of main phase grains of the main phase includes at least three regions where the concentration of the heavy rare earth elements differs, the three regions being: a low concentration region where the concentration of the heavy rare earth elements is the lowest in three regions, a high concentration region where the concentration of the heavy rare earth elements is the highest in three regions, and an intermediate concentration region where the concentration of the heavy rare earth elements is higher than the low concentration region and is lower than the high concentration region, the three regions exist in order of the low concentration region, the high concentration region, and the intermediate concentration region, from the low concentration region in the main phase grain toward the grain boundary phase; an area ratio of the high concentration region with respect to the main phase is from 1 to 35%; main phase grains wherein the high concentration region contacts an overall periphery of the low concentration region and the intermediate concentration region contacts an overall periphery of the high concentration region exist at 5% or more in the sintered rare earth magnet, an average concentration value of the heavy rare earth element in the intermediate concentration region is determined as the average concentration value of the heavy rare earth element from the maximum concentration of the heavy rare earth element to the grain boundary phase, and a value of the following formula (A) is in a range of 0.2 to 0.8: (.gamma.-.alpha.)/(.beta.-.alpha.) (A) where: .alpha.=the minimum

concentration of the heavy rare earth element in the main phase, .beta.=the maximum concentration of the heavy rare earth element in the main phase, and .gamma.=the average concentration value of the heavy rare earth element in the intermediate concentration region.

5. A sintered rare earth magnet, comprising: a main phase composed of R.sub.2T.sub.14B, where: R comprises as a main component one or more rare earth element selected from: Nd, Pr, and Nd and Pr, and T represents one or more transition metal element selected from: Fe, and Fe and Co; and a grain boundary phase containing a higher proportion of R than the main phase; wherein: the main phase includes one or more heavy rare earth element selected from: Dy, Tb, and Dy and Tb; at least a part of main phase grains of the main phase includes at least three regions where the concentration of the heavy rare earth elements differs, the three regions being: a low concentration region where the concentration of the heavy rare earth elements is the lowest in three regions, a high concentration region where the concentration of the heavy rare earth elements is the highest in three regions, and an intermediate concentration region where the concentration of the heavy rare earth elements is higher than the low concentration region and is lower than the high concentration region, the three regions exist in order of the low concentration region, the high concentration region, and the intermediate concentration region, from the low concentration region in the main phase grain toward the grain boundary phase; an average area ratio of the high concentration region with respect to the main phase is 5% or more; main phase grains wherein the high concentration region contacts an overall periphery of the low concentration region and the intermediate concentration region contacts an overall periphery of the high concentration region exist at 5% or more in the sintered rare earth magnet, an average concentration value of the heavy rare earth element in the intermediate concentration region is determined as the average concentration value of the heavy rare earth element from the

			maximum concentration of the heavy rare earth element to the grain boundary phase, and a value of the following formula (A) is in a range of 0.2 to 0.8: (.gammaalpha.)/(.betaalpha.) (A) where: .alpha.=the minimum concentration of the heavy rare earth element in the main phase, .beta.=the maximum concentration of the heavy rare earth element in the main phase, and .gamma.=the average concentration value of the heavy rare earth element in the intermediate concentration region.
Filed: September 26, 2008	9,175,376	Assignee: HITACHI METALS, LTD. (Tokyo, Japan)	Method for producing surface-modified rare earth metal-based sintered magnet and surface-modified rare earth metal-based sintered magnet  Abstract
Issued: November 3, 2015  Expires: September 2028			An objective of the present invention is to provide a rare earth metal-based sintered magnet having imparted thereto sufficient corrosion resistance by an oxidative heat treatment, which is resistant even in an environment of fluctuating humidity, while suppressing the deterioration of the magnetic characteristics ascribed to the oxidative heat treatment, and to provide a method for producing the same. As a means of achieving the objective above, the surface-modified rare earth metal-based sintered magnet of the present invention is characterized in that the surface-modified part comprises a surface-modified layer comprising at least three layers formed in this order from the inner side of the magnet, a main layer containing R, Fe, B, and oxygen, an amorphous layer containing at least R, Fe, and oxygen, and an outermost layer containing iron oxide comprising mainly hematite as the constituent, and the method for producing the same is characterized in that it comprises a step of applying a heat treatment to a bulk magnet body in the temperature range of from 200.degree. C. to 600.degree. C., under an atmosphere with oxygen partial pressure in a range of from 1.times.10.sup.2 Pa to 1.times.10.sup.5 Pa and water vapor partial pressure in a range of from 0.1 Pa to 1000 Pa (exclusive of 1000 Pa).

## The invention claimed is:

- 1. A method *[presumptive process/method]* for producing a surface-modified rare earth metal-based sintered magnet, the method comprising a step of: applying a heat treatment to a rare earth metal-based sintered magnet in the temperature range of from 200.degree. C. to 600.degree. C., under an atmosphere with oxygen partial pressure in a range of from 1.times.10.sup.2 Pa to 1.times.10.sup.5 Pa and water vapor partial pressure in a range of from 250 Pa to 700 Pa, wherein the surface-modified rare earth metal-based sintered magnet comprises a surface-modified part that comprises a surface-modified layer, said surface-modified layer comprising at least: a main layer containing R, Fe, B, and oxygen, and containing an R-enriched layer with a length in a range of from 0.5 .mu.m to 30 .mu.m and a thickness in a range of from 50 nm to 400 nm, an amorphous layer located outside of the main layer and containing at least R, Fe, and oxygen, and an outermost layer located outside of the amorphous layer and containing iron oxide, wherein the iron oxide is 75 mass % or more hematite.
- 3. A method for producing a surface-modified rare earth metal-based sintered magnet, the method comprising a step of: applying a heat treatment to a rare earth metal-based sintered magnet in the temperature range of from 200.degree. C. to 600.degree. C., under an atmosphere with oxygen partial pressure in a range of from 1.times.10.sup.2 Pa to 1.times.10.sup.5 Pa and water vapor partial pressure in a range of from 0.1 Pa to 700 Pa wherein the surface-modified rare earth metal-based sintered magnet comprises a surface-modified part that comprises a surface-modified layer, said surface-modified layer comprising at least: a main layer containing R, Fe, B, and oxygen, and containing an R-enriched layer with a length in a range of from 0.5 .mu.m to 30 .mu.m and a thickness in a range of from 50 nm to 400 nm, an amorphous

			layer located outside of the main layer and containing at least R, Fe, and oxygen, and an outermost layer located outside of the amorphous layer and containing iron oxide, wherein the iron oxide is 75 mass % or more hematite, characterized in that an additional heat treatment is carried out prior to and/or after the heat treatment, in the temperature range of from 200.degree. C. to 600.degree. C. and under an atmosphere with oxygen partial pressure in a range of from 1.times.10.sup2 Pa to 50 Pa and water vapor partial pressure in a range of from 1.times.10.sup7 Pa to 1.times.10.sup2 Pa.
Filed:	9,154,004	Assignee:	Rare earth sintered magnet and motor
March 4,		TDK CORP. (Tokyo,	
2011		Japan)	Abstract
Issued: October 6, 2015  Expires: March 2031			In the <i>rare earth</i> sintered <i>magnet</i> , the ratio of R2 to the sum of R1 and R2 that are contained in crystal grain boundaries surrounding the crystal grains in the <i>rare earth</i> sintered <i>magnet</i> body is higher than the ratio of R2 to the sum of R1 and R2 in the crystal grains, and the concentration of R2 increases from the central portion of the <i>rare earth</i> sintered <i>magnet</i> body toward the surface of the <i>rare earth</i> sintered <i>magnet</i> body. In addition, the degree of unevenness in residual magnetic flux density on the surface of the <i>rare earth</i> sintered <i>magnet</i> body is smaller than 3.0%.
			The invention claimed is:
			1. A rare earth sintered magnet comprising [presumptive composition of matter], a rare earth sintered magnet body including crystal grains of (R1, R2).sub.2T.sub.14B; wherein: R1 represents at least one rare earth element except for Dy and Tb, R2 represents a rare earth element at least including one or both of Dy and Tb, T represents one or more transition metal elements including Fe or including Fe and Co, a ratio of R2 to a sum of R1 and R2 that is contained in crystal grain boundaries surrounding the crystal grains in the rare earth sintered magnet body is higher than a ratio of R2 to a sum of R1 and R2 in the crystal grains, a concentration of R2 increases from a central portion

			of the rare earth sintered magnet body toward a surface of the rare earth sintered magnet body; and a degree of unevenness in residual magnetic flux density among a plurality of areas on the surface of the rare earth sintered magnet body is smaller than 3.0%.
			4. A rare earth sintered magnet obtained by [presumptive process or method] : rotating a rare earth sintered magnet body including crystal grains of (R1, R2).sub.2T.sub.14B, applying a slurry containing a compound of the rare earth element R2 to the rare earth sintered magnet body, drying the slurry while the rare earth sintered magnet body is rotated, and subjecting the rare earth sintered magnet body including the dried slurry to heat treatment, wherein: R1 represents at least one rare earth element except for Dy and Tb, R2 represents a rare earth element at least including one or both of Dy and Tb, T represents one or more transition metal elements including Fe or including Fe and Co, a ratio of R2 to a sum of R1 and R2 that is contained in crystal grain boundaries surrounding the crystal grains in the rare earth sintered magnet body is higher than a ratio of R2 to a sum of R1 and R2 in the crystal grains, a concentration of R2 increases from a central portion of the rare earth sintered magnet body toward a surface of the rare earth sintered magnet body; and a degree of unevenness in residual magnetic flux density among a plurality of areas on the surface of the rare earth sintered magnet body is smaller than 3.0%

September			Disclosed is a sintered magnet which is a rare-earth magnet using a less
8, 2015			amount of a rare-earth element but having a higher maximum energy product
Eveninas			and a higher coercivity. The sintered magnet includes a NdFeB crystal; and an
Expires: August			FeCo crystal adjacent to the NdFeB crystal through the medium of a grain boundary. The FeCo crystal includes a core and a periphery and has a cobalt
2032			concentration decreasing from the core to the periphery. The FeCo crystal has

a difference in cobalt concentration of 2 atomic percent or more between the core and the periphery. In the NdFeB crystal, cobalt and a heavy rare-earth element are unevenly distributed and enriched in the vicinity of the grain boundary.

## What is claimed is:

- 1. A sintered magnet comprising [presumptive composition of matter], : a NdFeB crystal; an FeCo crystal; and a grain boundary region disposed between the NdFeB crystal and the FeCo crystal, wherein the FeCo crystal has a cobalt concentration decreasing from a center to an interface by 2 atomic percent or more, and wherein the NdFeB crystal contains cobalt and a heavy rare-earth element, and has concentrations of the cobalt and the heavy rare-earth element increasing from a center to an interface.
- 2. The sintered magnet according to claim 1, wherein the FeCo crystal includes a body-centered cubic structure or a body-centered tetragonal structure.
- 3. The sintered magnet according to claim 1, wherein the FeCo crystal has a saturation flux density higher than the saturation flux density of the NdFeB crystal.
- 4. The sintered magnet according to claim 1, wherein the grain boundary region has a width of 0.1 to  $2\ nm$ .
- 5. The sintered magnet according to claim 1, wherein the grain boundary region includes an acid fluoride.
- 8. The sintered magnet according to claim 1, being prepared through [presumptive process/method] quenching in a magnetic field at a cooling rate of 10.degree. C./second or more in a heat treatment process upon sintering.

	7,

- 2. The permanent magnet according to claim 1, wherein the element R is at least one selected from samarium (Sm), neodymium (Nd), and praseodymium (Pr).
- 3. The permanent magnet according to claim 2, wherein 50 atomic % or more of the element R is samarium (Sm).
- 4. The permanent magnet according to claim 3, wherein 80 atomic % or more of the element M is zirconium (Zr).
- 9. A method of manufacturing a permanent magnet, comprising: fabricating an alloy powder having a composition represented by a composition formula: R(Fe.sub.p(Ti.sub.sM.sub.1-s).sub.qCu.sub.r(Co.sub.1-tA.sub.t).sub.1-p-qr).sub.z where, R is at least one element selected from rare earth elements, M is at least one element selected from Zr and Hf, A is at least one element selected from Ni, V, Cr, Mn, Al, Ga, Nb, Ta and W, p is a number (atomic ratio) satisfying 0.3.ltoreq.p.ltoreq.0.6, q is a number (atomic ratio) satisfying 0.01.ltoreq.q.ltoreq.0.1, r is a number (atomic ratio) satisfying 0.01.ltoreq.r.ltoreq.0.15, s is a number (atomic ratio) satisfying 0.2.ltoreq.s.ltoreq.0.5, t is a number (atomic ratio) satisfying 0.ltoreq.t.ltoreq.0.2, z is a number (atomic ratio) satisfying 6.ltoreq.z.ltoreq.9; fabricating a pressed powder body by forming the alloy powder in a magnetic field; fabricating a sintered body by sintering the pressed powder body; performing a solution heat treatment to the sintered body at a temperature of from 1130 to 1230.degree. C.; performing an aging heat treatment to the sintered body after the solution heat treatment at a temperature of from 700 to 900.degree. C. in a vacuum atmosphere; and cooling slowly the sintered body after the aging heat treatment at a cooling speed in a range of 0.5 to 5.degree. C./min, to obtain the permanent magnet including a structure composed mainly of a Th.sub.2Zn.sub.17 crystal phase and a CaCu.sub.5 crystal phase, wherein a ratio (c/a) of a lattice constant c in relation to a lattice constant a in a crystal structure of the permanent magnet is equal to or more than 0.839, where a

			crystal face perpendicular to a direction of an easy magnetization axis is a face a, one of crystal faces parallel to the direction of the easy magnetization axis is a face b, an x-ray main diffraction angle of the face a is 2.thetasub.1, an x-ray main diffraction angle of the face b is 2.thetasub.2, the lattice constant a is defined by 4/3.sup.1/2 .times.d1, the lattice constant c is defined by 2 .times.d.sub.2, d.sub.1 [unit: angstrom] is .lamda./(2sin(2.thetasub.1/2), d2 [unit: angstrom] is .lamda./(2sin(2.thetasub.2/2), and .lamda.is 1.5418 angstrom.
			10. The manufacturing method [ <b>presumptive process/method</b> ] according to claim 9, wherein the fabricating the alloy powder comprises: fabricating a thin ribbon solidified to have a thickness of equal to or less than 1 mm continuously by injecting an alloy molten metal to a chill roll rotating at a peripheral speed of 0.1 to 20 m/sec; and grinding the thin ribbon.
Filed: Dec 1, 2008	9,082,538	Assignee: ZHEJIANG UNIVERSITY	Sintered NdFeB permanent magnet with high coercivity for high temperature applications
Issued: July 14,		(Hangzhou, China)	Abstract
2015		ZHEJIANG INNUOVO	A type of sintered NdFeB permanent magnet with high intrinsic coercivity of about 30KOe or more is produced by dual alloy method. The method
Expires: Dec 2028		MAGNETICS INDUSTRY CO., LTD (Dongyang, China)	comprises the following steps: preparing the powders of master phase alloy and intergranular phase alloy respectively, mixing the powders, compacting the powders in magnetic field, sintering the compacted body at 1050.about.1125.degree. C. and annealing at 890-1000.degree. C. and 500-650.degree. C. successively. In the process of preparing the powder of intergranular phase alloy, the nano-powder additive selected from the group consisting of NiAl, TiC, SiC, AlN, TiN, ZrN and the combination thereof is used to modify the powder of intergranular phase alloy.
			We claim that:

- 1. A sintered Nd--Fe--B permanent magnet, comprising [presumptive **composition of matter**]: (A) 90.about.95 wt % of a master-phase alloy powder, by weight of the permanent magnet, wherein the master-phase alloy powder comprises 11.about.16% of Nd, 5.4.about.6.6% of B, 0.about.6% of M and a balance of Fe by atomic percent, wherein M is at least one selected from the group consisting of Dy, Tb, Nb, Co, Ga, Zr, and Al; and (B) 5.about.10 wt % of an intergranular-phase alloy powder, by weight of the permanent magnet, wherein the intergranular-phase alloy powder is modified by a nano-powder additive before being sintered to form the sintered Nd--Fe--B permanent magnet, the nano-powder additive is at least one selected from the group consisting of NiAl, TiC, SiC, AlN, TiN, and ZrN, the intergranular-phase alloy powder before being modified comprises 13.5.about.30% of Nd, 4.about.7% of B, 0.about.15% of R and a balance of Fe by atomic percent, where R is at least one selected from the group consisting of Dy, Tb, Nb, Co, Ga, Zr, Cu, Al, and Si, the sintered Nd--Fe--B permanent magnet is obtained by a two-alloy method, the intergranular-phase alloy powder is modified by an amount of the nano-powder additive sufficient so that the sintered Nd--Fe--B permanent magnet has an intrinsic coercivity of about 30KOe or more, and the amount of the nano-powder additive is 0.01.about.1% by weight of the intergranularphase alloy powder.
- 2. The magnet of claim 1, wherein the nano-powder additive has an average particle size of 1.about.60 nm.
- 3. The magnet of claim 1, wherein the magnet is obtained by [presumptive process/method]: preparing the master-phase alloy powder with a particle size of 3-8 .mu.m; preparing the intergranular-phase alloy powder with a particle size of 1-4 .mu.m, and modifying with a predetermined amount of the nanopowder additive; mixing the master-phase alloy powder and the intergranular-phase alloy powder that is modified by the nano-powder additive to form a

			well-proportioned mixture; compacting said well-proportioned mixture in a magnetic field of 1.2-2.0 T to form a compacted body, sintering the compacted body at a temperature of 1050-1125.degree. C. in a high vacuum sintering furnace of 10.sup3-10.sup4 pa to form a sintered body; heating the sintered body at a temperature of 890-1000.degree. C. for 2-4 hours followed by slowly cooling at a cooling rate of 1-4.degree. C./min to room temperature; and heating the cooled sintered body at a temperature of 500-650.degree. C. for 2-4 hours followed by rapidly cooling at a cooling rate of 100-400.degree. C./min, to form the NdFeB permanent magnet.  4. The magnet of claim 1, wherein the magnet includes main phase grains that are substantially spherical with an average size of about 5 .mu.m to about 6 .mu.m.
Filed:	9,082,537	Assignee:	R-T-B based permanent magnet
April 25,		TDK CORPORATION	
2014		(Tokyo, Japan)	Abstract
Issued: July 14, 2015 Expires: April 2034			The present invention provides a permanent magnet which is excellent in the temperature properties and the magnetic properties of which will not be significantly decreased, compared to the conventional R-T-B based permanent magnet. In the R-T-B based structure, a stacked structure of R1-T-B based crystal layer and Y-T-B based crystal layer can be formed by alternatively stacking R1-T-B and Y-T-B. In this way, a high magnetic anisotropy field of the R1-T-B based crystal layer can be maintained while the temperature coefficient of the Y-T-B based crystal layer can be improved.
			What is claimed is:
			1. A R-T-B based permanent magnet, comprising [presumptive composition of matter] a R-T-B based structure in which a R1-T-B based crystal layer and a Y-T-B based crystal layer are stacked, wherein R1 represents at least one rare

			earth element except Y, and T represents at least one transition metal element comprising Fe or a combination of Fe and Co.
			<ul> <li>2. The R-T-B based permanent magnet according to claim 1, wherein an atomic ratio of R1 to Y is 0.1 or more and 10 or less.</li> <li>4. The R-T-B based permanent magnet according to claim 2, wherein said R1-T-B based crystal layer has a thickness of 0.6 nm or more and 300 nm or less, and said Y-T-B based crystal layer has a thickness of 0.6 nm or more and 200 nm or less.</li> </ul>
			5. A R-T-B based film permanent magnet, comprising a R-T-B based structure in which a R1-T-B based crystal layer and Y-T-B based crystal layer are stacked, wherein R1 represents at least one rare earth element except Y, and T represents at least one transition metal element comprising Fe or a combination of Fe and Co.
			6. The R-T-B based film permanent magnet according to claim 5, wherein an atomic ratio of R to Y is 0.1 or more and 10 or less.
			9. A R-T-B based permanent magnet powder, comprising a R-T-B based structure in which a R1-T-B based crystal layer and a Y-T-B based crystal layer are stacked, wherein R1 represents at least one rare earth element except Y, and T represents at least one transition metal element comprising Fe or a combination of Fe and Co.

Expires:	
Dec 2030	

earth-iron-based alloy material, and a rare-earth-iron-nitrogen-based alloy material which are used as materials for the magnet, and methods for producing the powder compact and these alloy materials. Magnetic particles 1 constituting the powder for a magnet each have a texture in which grains of a phase 3 of a hydride of a rare-earth element are dispersed in a phase 2 of an iron-containing material, such as Fe. The uniform presence of the phase 2 of the iron-containing material in each magnetic particle 1 results in the powder having excellent formability, thereby providing a powder compact 4 having a high relative density. The powder for a magnet is produced by heat-treating a rare-earth-iron-based alloy powder in a hydrogen atmosphere to separate the rare-earth element and the iron-containing material from each other and then forming a hydride of the rare-earth element. The powder for a magnet is subjected to compacting to form the powder compact 4. The powder compact 4 is subjected to heat treatment in vacuum to form a rare-earth-iron-based alloy material 5. The rare-earth-iron-based alloy material 5 is subjected to heat treatment in a nitrogen atmosphere to form a rare-earth-iron-nitrogen-based alloy material 6.

The invention claimed is:

1. A powder compact used as a material for a rare-earth magnet comprising [presumptive composition of matter]: a powder comprising: magnetic particles each containing a hydride of a rare-earth element in an amount of less than 40% by volume and the balance being Fe; a phase of the hydride of the rare-earth element is adjacent to a phase consisting of pure Fe, and an interval between adjacent phases of the hydride of the rare-earth element with the phase of Fe provided therebetween is 3 .mu.m or less, wherein: the phase of the hydride of the rare-earth element is granular, the granular hydride of the rare-earth element is dispersed in the phase of Fe, the rare-earth element is Sm, and the hydride of the rare-earth element consisting of Sm and hydrogen, an antioxidation layer is provided on the surface of each of the magnetic particles,

			the antioxidation layer including a low-oxygen-permeability layer composed of a material having an oxygen permeability coefficient at 30.degree. C. of less than 1.0.times.10.sup11 m.sup.3m/(sm.sup.2Pa) and a low-moisture-permeability layer composed of a material having a moisture permeability coefficient at 30.degree. C. of less than 1000.times.10.sup13 kg/(msMPa), the low-oxygen-permeability layer is polyester or polyvinyl chloride, and the powder compact has a relative density of 85% or more.
			2. The powder compact used as a material for a rare-earth magnet according to claim 1, wherein the magnetic particles have an average particle size of 10 .mu.m to 500 .mu.m.
			3. The powder compact used as a material for a rare-earth magnet according to claim 1, wherein the powder compact has a relative density of 90% or more.
			4. The powder compact used as a material for a rare-earth magnet according to claim 1, wherein the low-moisture-permeability layer is polyethylene or polypropylene.

April 2034			anisotropy field of the R1-T-B based crystallizing layer can be maintained while an improved temperature coefficient of the (Y, La)-T-B based
			crystallizing layer can be obtained. Further, the lattice distortion in the total
			stacked structure is moderated by setting the <i>rare earth</i> elements in the (Y, La)-T-B based crystallizing layer as both of Y and La, and a high residual flux
			density can be obtained accordingly.

			What is claimed is:  1. A R-T-B based permanent <i>magnet</i> , comprising <i>[presumptive composition of matter]</i> , : a R-T-B based structure in which a R1-T-B based crystallizing layer and a (Y, La)-T-B based crystallizing layer are stacked, wherein R1 is at least one <i>rare earth</i> element except Y and La, and T is one or more transition metal element comprising Fe or the combination of Fe and Co.  2. The R-T-B based permanent <i>magnet</i> according to claim 1, wherein an atomic ratio of R1 to Y and La is 0.1 or more and 10 or less.  16. A bond magnet comprising the R-T-B based permanent magnet powder of claim 12.
			17. A sintered magnet comprising the R-T-B based permanent magnet powder of claim 9.
Filed: March 28, 2011  Issued: June 9, 2015  Expires: March 2031	9,053,846	Assignee: NITTO DENKO CORPORATION (Osaka, Japan)	Abstract There are provided a permanent <i>magnet</i> and a manufacturing method thereof enabling carbon content contained in <i>magnet</i> particles to be reduced in advance before sintering even when wet milling is employed. Coarsely-milled <i>magnet</i> powder is further milled by a bead mill in a solvent together with an organometallic compound expressed with a structural formula of M-(OR).sub.x (M includes at least one of neodymium, praseodymium, dysprosium and terbium, each being a <i>rare earth</i> element, R represents a substituent group consisting of a straight-chain or branched-chain hydrocarbon, x represents an arbitrary integer) so as to uniformly adhere the organometallic compound to particle surfaces of the <i>magnet</i> powder. Thereafter, a compact

body of compacted *magnet* powder is held for several hours in hydrogen atmosphere at 200 through 900 degrees Celsius to perform hydrogen calcination process. Thereafter, through sintering process, a permanent *magnet* 1 is manufactured.

The invention claimed is:

- 1. A manufacturing method of a permanent magnet comprising steps of wetmilling magnet material in an organic solvent to obtain magnet powder; adding, to the organic solvent during the wet-milling, an organometallic compound expressed with a structural formula of M-(OR).sub.x, M including at least one of neodymium, praseodymium, dysprosium and terbium, each being a rare earth element, R representing a substituent group consisting of a straight-chain or branched-chain hydrocarbon, and x representing an arbitrary integer, to make the organometallic compound adhered to particle surfaces of the magnet powder in the organic solvent to obtain a slurry-state magnet powder; injecting the slurry-state magnet powder containing the organic solvent used in the wet-milling into a cavity without drying the slurry-state magnet powder, while applying an initial magnetic field to the cavity, and further applying a magnetic field stronger than the initial magnetic field to the cavity during or after the injection so as to perform wet molding and obtain a compact body in which the organometallic compound is adhered to the particle surfaces of the magnet powder; calcining the compact body in hydrogen atmosphere so as to obtain a calcined body of which carbon residue is reduced in comparison with before calcining the compact body, wherein the step of calcining causes thermal decomposition of the organometallic compound and removes R so as to reduce carbon residue; and sintering the calcined body.
- 2. The manufacturing method of a permanent magnet according to claim 1, wherein R in the structural formula is an alkyl group.

			3. The manufacturing method of a permanent magnet according to claim 2, wherein R in the structural formula is an alkyl group of which carbon number is any one of integer numbers 2 through 6.

2005		(Tokyo, Japan)	
T 1			Abstract
Issued: April 14,			The present invention aims to provide a rare earth magnet having sufficiently
2015			excellent anticorrosion property. The rare earth magnet 1 according to the present invention to solve the above problems includes a magnet body 10
Expires:			containing rare earth elements, a substantial amorphous layer 20 formed on a
March 2025			surface of the magnet body 10, and a protecting layer 30 on a surface of the amorphous layer 20, and the amorphous layer 20 contains material identical to main component elements of magnet material contained in the magnet body 10.
1			

			The invention claimed is:
			1. A rare earth magnet comprising [presumptive composition of matter]: a magnet body containing a rare earth element; an amorphous layer formed on a surface of the magnet body and containing amorphous substance; and a protecting layer formed on a surface of the amorphous layer, wherein the magnet body is polycrystalline and contains polycrystal substance, a boundary between the magnet body and the amorphous layer includes a region where the polycrystal substance of the magnet body and the amorphous substance of the amorphous layer are mixed, the amorphous layer has a film thickness from 0.3 to 10 .mu.m, the protecting layer consists of aluminum, the amorphous layer is amorphized from a surface of the magnet body and contains an element identical to a main component element of a magnet material contained in the magnet body, a roughness Ra of a boundary between the magnet body and the amorphous layer ranges from 1.27 to 1.45 .mu.m, a roughness Ra of a boundary between the amorphous layer and the protecting layer ranges from 0.68 to 0.85 .mu.m, and a coefficient of thermal expansion of the amorphous layer.
Filed: March 31, 2011	8,986,568	Assignee: TDK Corporation (Tokyo, Japan)	Sintered magnet and method for producing the sintered magnet  Abstract
Issued: March 24, 2015 Expires:			The present invention aims to ensure strength of a thin-walled sintered magnet. A sintered magnet is a ferrite sintered magnet made by sintering a magnetic material. A magnetic powder mixture obtained by mixing magnetic powder with a binder resin is injection-molded into a mold with a magnetic field applied thereto to produce a molded body, which is then sintered to produce

March	the sintered magnet. The sintered magnet has a thickness of 3.5 mm or less in
2031	the position of center of gravity thereof. The sintered magnet has a surface roughness Rz of 0.1 .mu.m or more and 2.5 .mu.m or less. The surface
	roughness Rz is a 10 point average roughness.
	The invention claimed is:
	1. A sintered magnet made by [presumptive process/method]: sintering a magnetic material, the sintered magnet having a thickness of 3.5 mm or less in
	the position of center of gravity thereof and a surface roughness Rz of 2.5 .mu.m or less, And the sintered magnet is a hard ferrite sintered magnet.
	2. The sintered magnet according to claim 1, wherein the surface roughness Rais 0.1 .mu.m or more <i>[presumptive composition of matter]</i> .
	BACKGROUND
	Sintered magnets are widely used for motors and the like mounted in
	household electric appliances, automobiles, and the like. In recent years, smaller and thinner-walled sintered magnets are sought after for requirements
	for space saving, fuel economy improvement, and the like. In order to improve strength of a ferrite sintered <i>magnet</i> , for example, Japanese Patent Application
	Laid-Open No. 2002-353021 discloses a technique described below. In this technique, powder to be molded is substantially composed of magnetic powder
	obtained by powderizing a ferrite sintered <i>magnet</i> containing Fe, an element A <b>an element R</b> and an element M, or substantially composed of the magnetic

and the element M. .....

powder and raw material powder containing Fe, the element A, the element R

a sintered *magnet* according to the present embodiment. The sintered *magnet* to be described below is a sintered metallic *magnet*, and particularly a rare-earth sintered magnet having a composition of R--Fe--B (where R is a rare-earth element). The sintered metallic magnet to which the method for producing a sintered magnet according to the present embodiment can be applied is not limited to this type. In the present embodiment, two or more types of alloys are combined so as to obtain a final composition, and then sintered to produce the sintered magnet. In the present embodiment, an alloy (low R alloy) mainly composed of R.sub.2Fe.sub.14B crystal grains is combined with an alloy containing a higher amount of R than the low R alloy (high R alloy). However, three or more types of alloys can be combined. Otherwise, the rare-earth sintered magnet can be produced from one type of alloy. When the sintered magnet is produced using the method for producing the sintered magnet according to the present embodiment, the low R alloy and the high R alloy are prepared (step S21).

The low R alloy and the high R alloy are prepared, for example, using a strip casting method. The strip casting method is preferably used because it can improve magnetic characteristics by suppressing the crystal grains from growing in the low R alloy and the high R alloy. The method for preparing the low R alloy and the high R alloy is not limited to this method, but a casting method (such as a centrifugal casting method) can be used. Next, the low R alloy and the high R alloy are coarsely milled (step S22). In the present embodiment, hydrogen milling or mechanical milling (such as disk milling) is used for the coarse milling. However, the method for the coarse milling is not limited to these methods.

In the case of performing the hydrogen milling in the present embodiment, the low R alloy and the high R alloy are held in a hydrogen atmosphere for one hour to five hours at a temperature between about room temperature and 100.degree. C. to allow the low R alloy and the high R alloy to occlude

hydrogen and to be milled. Thereafter, the low R alloy and the high R alloy are heated to a temperature of 500.degree. C. to 600.degree. C., and held at that temperature for about one hour to about ten hours so as to be dehydrogenated. After the coarse milling is finished, the coarsely milled powders of the low R alloy and the high R alloy are finely milled (step S23). In the present embodiment, jet milling using an inert gas (such as N.sub.2 gas) is used (but not limited thereto) for the fine milling. By the fine milling, low R alloy powder is obtained from the low R alloy, and high R alloy powder is obtained from the high R alloy.

The low R alloy powder and the high R alloy powder after being prepared are mixed at a predetermined ratio (step S24). After the low R alloy powder and the high R alloy powder are mixed, the powder mixture of the low R alloy powder and the high R alloy powder is molded into a predetermined shape to be produced as a molded body (step S25). In the molding of the powder mixture, a predetermined molding pressure is applied to the powder mixture to mold it. In this case, the molding is preferably performed in a magnetic field of an intensity of 800 kA/m or more in order to orient the low R alloy powder and the high R alloy powder. The molding pressure is preferably from about 10 MPa to about 500 MPa.

Thereafter, the molded body thus obtained is sintered (step S26). In the sintering, the molded body obtained in step S25 is sintered in vacuum (reduced pressure atmosphere) for a predetermined time at a predetermined temperature, and thus, a sintered body is obtained. For example, the sintering temperature is set in the range from 1000.degree. C. to 1100.degree. C., and the molded body is sintered for about one hour to about ten hours. A short sintering time increases variability in density and magnetic characteristics of the obtained sintered body while a too long sintering time reduces the productivity of the sintered *magnet*. Therefore, the sintering time is determined by considering a balance between the variability and the productivity.

After the sintering process is finished, an aging treatment is applied to the sintered body in air, or preferably, in an inert gas atmosphere (step S27). The aging treatment is a treatment of adjusting the magnetic characteristics of the sintered *magnet* to be obtained by holding the sintered body for a predetermined time at a temperature lower than the sintering temperature and thus by adjusting a structure of the sintered body. The aging treatment is applied under appropriate conditions so as to obtain high magnetic characteristics (such as a coercive force HcJ and a good squareness). The aging treatment can be applied in two stages. In this case, the aging temperature is kept at 700.degree. C. to 900.degree. C. at the first stage, and at 450.degree. C. to 600.degree. C. at the second stage, and the sintered body is held in each of the temperature ranges for one hour to ten hours.

The sintered body after finishing the aging treatment is processed as necessary (step S28). The sintered *magnet* according to the present embodiment needs to be made to have a surface roughness Rz of 2.5 .mu.m or less before being subjected to a surface treatment. For this reason, the sintered body after finishing the aging treatment and necessary processing is ground on surfaces thereof as necessary so as to have the surface roughness Rz of 2.5 .mu.m or less, and thus is made to be a sintered *magnet*. This sintered *magnet* has the surface roughness Rz of 2.5 .mu.m or less, and thus is ensured to have a sufficient strength even if it is thin-walled. A surface treatment (such as plating or resin coating) for suppression of corrosion is applied to the sintered *magnet* having the surface roughness Rz of 2.5 .mu.m or less. The sintered *magnet* is then magnetized.

In the molding process (step S25), the molded body may be obtained by injection molding. In this case, the molded body is produced in the following manner. First, the low R alloy powder and the high R alloy powder prepared by the procedure up to step S24 are mixed at a predetermined ratio to obtain

magnetic powder. The obtained magnetic powder is mixed with a binder resin, a wax, a lubricant, and a plasticizer, and then kneaded with a kneader for a predetermined time (about two hours) at a temperature of about 150.degree. C. to obtain a kneaded mixture. This kneading is the same as the kneading performed in step S16 described above. The obtained kneaded mixture is molded with a pelletizer (such as a twin taper single extruder). Thus, pellets (magnetic powder mixture) in which the magnetic powder is dispersed in the binder resin are obtained. The obtained pellets are injection-molded to obtain a magnetic powder molded body. The injection molding is the same as that performed in step S17 described above.

As described above, by setting the surface roughness Rz to 2.5 .mu.m or less, the sintered *magnet* according to the present embodiment can be ensured to have a sufficient strength even if it is thin-walled. In the method for producing a sintered *magnet* according to the present embodiment, the magnetic powder mixture that is a mixture of the magnetic powder and the binder resin is injection-molded into the mold, and the mold has a surface roughness of 3.0 .mu.m or less on the surface thereof in contact with the magnetic powder mixture. The sintered *magnet* having the surface roughness Rz of 2.5 .mu.m or less can easily be produced by sintering a molded body obtained from such a mold.

In the case of production of the ferrite sintered *magnet* among types of sintered *magnet*, Si and the like are sometimes added as an auxiliary agent in the middle of the process. However, after sintering, most of these elements gather at crystal grain boundaries of the sintered *magnet*, and hardly appear on the surface. The *rare-earth* sintered *magnet* is subjected to the aging treatment after the sintering. However, the temperature of the aging treatment is lower than a temperature required for forming a heterogeneous phase in a glass state containing Si and the like. In addition, the ferrite sintered *magnet* is not generally subjected to a heat treatment after the sintering. Therefore, in the

			sintered <i>magnet</i> , the surface roughness Rz cannot be reduced by making the heterogeneous phase appear on the surface of the sintered <i>magnet</i> .  Accordingly, in order to ensure the strength of the thin-walled sintered <i>magnet</i> , it is necessary to reduce the surface roughness Rz of the sintered <i>magnet</i> itself without making the heterogeneous phase appear on the surface thereof.

			The invention claimed is:
			1. A sintered ferrite <i>magnet</i> having a ferrite phase with a hexagonal structure as the main phase, wherein the composition of the metal elements composing

the main phase is represented by the following general formula [presumptive composition of matter], (1): R.sub.xCa.sub.mA.sub.1-x-m(Fe.sub.12yM.sub.y).sub.z: (1) wherein R represents at least one element selected from the group consisting of La, Ce, Pr, Nd and Sm and including La as an essential component, A represents Sr and/or Ba, and M represents at least one element selected from the group consisting of Co, Zn, Ni, Mn, Al and Cr and including Co as an essential component, x, m, y and z in formula (1) satisfying all of the conditions represented by the following formulas (2), (3), (4), (5) and (6): 0.2.ltoreq.x.ltoreq.0.5: (2) 0.13.ltoreq.m.ltoreq.0.41: (3) 0.7x-m.ltoreq.0.15: (4) 0.18.ltoreq.yz.ltoreq.0.31: (5) 9.6.ltoreq.12z.ltoreq.11.8: (6), wherein the density of the sintered ferrite magnet is at least 5.05 g/cm.sup.3, and the crystal grains of the sintered ferrite *magnet* satisfy all of the conditions represented by the following formulas (7) and (8), where L .mu.m is the average for the maximum value and S .mu.m is the average for the minimum value among the diameters passing through the center of gravity of each grains in the crystal cross-section parallel to the c-axis direction of hexagonal structures, L.ltoreq.0.95: (7) 1.8.ltoreq.L/S.ltoreq.2.5: (8).

2. The sintered ferrite *magnet* according to claim 1, wherein the sintered ferrite *magnet* is formed from a finely milled material having a mean particle size of 0.1-0.3.mu.m. *[presumptive composition of matter]* 

## **BACKGROUND ART**

Hexagonal Ba ferrite and Sr ferrite are known in the prior art as magnetic materials for use in sintered ferrite magnets. In recent years, magnetoplumbite (M-type) Ba ferrite and Sr ferrite have become the most commonly used ferrites. M-type ferrite is represented by the general formula AFe.sub.12O.sub.19, with Ba or Sr as the element represented by A. M-type ferrites, wherein the element represented by A is Sr with a portion thereof being replaced with a rare earth element and a portion of the Fe being replaced

			with Co, are known to exhibit excellent magnetic properties including residual flux density and coercive force (for example, see Patent documents 1 and 2). Such M-type ferrites must contain La as the rare earth element. This is because La is the rare earth element that has the highest solubility limit for hexagonal M-type ferrite. Patent documents 1 and 2 also teach that using La as a substitute element for the element represented by A can increase solubility of the Co which is substituting for a portion of the Fe, thus enhancing the magnetic properties as a result.
Filed: March 30, 2010	8,961,868	Assignee: Hitachi Metals, Ltd. (Tokyo, Japan)	Nanocomposite bulk magnet and process for producing same Abstract
Issued: February 24, 2015 Expires: March 2030			In a nanocomposite bulk magnet according to the present invention, nanocomposite magnet powder particles, including an Nd.sub.2Fe.sub.14B crystalline phase and an .alphaFe phase, are combined together. The composition of the magnet is represented by T.sub.100-x-y-z-n(B.sub.1-qC.sub.q).sub.xR.sub.yTi.sub.zM.sub.n, where T is at least one transition metal element selected from the group consisting of Fe, Co and Ni and always including Fe, R is at least one rare-earth element including substantially no La or Ce, M is an additive metallic element, and x, y, z, n and q satisfy 4 at %.ltoreq.x.ltoreq.10 at %, 6 at %.ltoreq.y.ltoreq.10 at %, 0.05 at %.ltoreq.z.ltoreq.5 at %, 0 at %.ltoreq.n.ltoreq.10 at %, and 0.ltoreq.q.ltoreq.0.5, respectively. The powder particles have a minor-axis size of less than 40 .mu.m. And powder particles, of which the major-axis size exceeds 53 .mu.m, account for at least 90 mass % of the entire magnet. And those powder particles are directly combined with each other. Consequently, a full-dense magnet, of which the density is 96% or more of the true density of its material alloy, is realized.  The invention claimed is:

- 1. A method for producing *[presumptive process/method]* a nanocomposite bulk magnet, the method comprising the steps of: providing a melt of an alloy having a composition represented by the compositional formula: T.sub.100-xy-z-n(B.sub.1-qC.sub.q).sub.xR.sub.yTi.sub.zM.sub.n, where T is at least one transition metal element that is selected from the group consisting of Fe, Co and Ni and that always includes Fe, R is at least one rare-earth element including substantially no La or Ce, and M is at least one metallic element selected from the group consisting of Al, Si, V, Cr, Mn, Cu, Zn, Ga, Zr, Nb, Mo, Ag, Hf, Ta, W, Pt, Au and Pb, and the mole fractions x, y, z, n and q satisfy the inequalities of: 4 at %.ltoreq.x.ltoreq.10 at %, 6 at %.ltoreq.y.ltoreq.10 at %, 0.05 at %.ltoreq.z.ltoreq.5 at %, 0 at %.ltoreq.n.ltoreq.10 at %, and 0.ltoreq.q.ltoreq.0.5, respectively, quenching the melt to make a rapidly solidified alloy, at least 30 vol % of which is crystalline phases that include an R.sub.2T.sub.14B phase and an .alpha.-Fe phase and that have an average crystal grain size of 100 nm or less and the balance of which is amorphous phases and which has a thickness of less than 40 .mu.m; pulverizing the rapidly solidified alloy, thereby obtaining a powder, at least 90 mass % of which is accounted for by powder particles with a major-axis size of more than 53 .mu.m; and compacting the powder while heating and pressing the powder, thereby making a bulk body in which nanocomposite magnet powder particles including the R.sub.2T.sub.14B phase and the .alpha.-Fe phase are combined together and of which the density is 96% or more of the true density of the alloy.
- 2. The method of claim 1, *[presumptive process/method]* wherein the step of quenching the melt includes quenching the melt at a quenching rate of 5.times.10.sup.4.degree. C./s to 5.times.10.sup.7.degree. C./s.
- 3. The method of claim 1, wherein the step of quenching the melt includes controlling the standard deviation .sigma. of the thickness of the rapidly

			solidified alloy to 4 .mu.m or less.
			4. The method of claim 1, wherein the step of compacting includes crystallizing the amorphous phases of the powder particles, thereby forming a nanocomposite magnet structure, 5 vol % to 60 vol % of which is accounted for by an .alphaFe phase with an average crystal grain size of 1 nm to 50 nm and 40 vol % to 95 vol % of which is accounted for by an R.sub.2T.sub.14B phase with an average crystal grain size of 5 nm to 100 nm.
Filed:	8,961,712	Assignee:	Rare earth based sintered magnet
August 2, 2012		TDK Corporation (Tokyo, Japan)	Abstract
Issued: February 24, 2015 Expires: August 2032			The present invention provides a rare earth based sintered magnet. The magnet is a rare earth based permanent magnet with a R-T-B (R represents one or more elements selected from Y and rare earth elements, T represents one or more metal elements including Fe or the combination of Fe and Co, and B represents B or the combination of B and C) based composition. When a R-rich phase (R represents rare earth element(s)) with atomic ratio of (Fe+Co)/(LR+HR+Fe+Co).ltoreq.0.2 (LR represents Y and light rare earth element(s) selected from .sup.57La to .sup.63Eu, and HR represents heavy rare earth element(s) selected from .sup.64Gd to .sup.71Lu) is present in the grain boundary triple point, a region with HR/(LR+HR).gtoreq.0.01 (atomic ratio) is present in the R-rich phase, and the region with HR/(LR+HR).gtoreq.0.01 accounts for 10% to 90% of the area of the grain boundary triple point.  What is claimed is:
			1. A rare earth based sintered magnet, wherein, it is a rare earth based permanent magnet having a R-T-B based composition <i>[presumptive]</i>
			composition of matter], wherein, R represents one or more elements selected from Y and rare earth elements, T represents one or more metal elements

Filed	9.045.219	Assignace	containing Fe or the combination of Fe and Co, and B represents B or the combination of B and C, a R-rich phase with the atomic ratio of (Fe+Co)/(LR+HR+Fe+Co).ltoreq.0.2 is present in the grain boundary triple point, and a region with the atomic ratio of HR/(LR+HR).gtoreq.0.01 is present in the R-rich phase and accounts for 10% to 90% of the area of the grain boundary triple point, wherein, LR represents one or more elements selected from Y and the light rare earth elements from .sup.57La to .sup.63Eu, and HR represents one or more elements selected from the heavy rare earth elements from .sup.64Gd to .sup.71Lu, said LR at least contains Nd or Pr, and said HR at least contains Dy or Tb.  2. The rare earth based sintered magnet according to claim 1, wherein, when the magnet was observed via an electron probe microanalyzer (EPMA) in a visual field of 10-100 .mu.m.times.10-100 .mu.m, the CV value of the detection signal of HR in the visual filed excluding the 50 .mu.m part of the surface layer of the magnet ranges from 0.15 to 0.5, and the CV value is obtained by dividing the standard deviation of all analysis points by the arithmetic mean of all analysis points.  3. The rare earth based sintered magnet according to claim 1, wherein, the content of R is 25 mass % or more and 35 mass % or less, the content of B is 0.9 mass % or more and 1.1 mass % or less, and the balance is the composition substantially containing T. [presumptive composition of matter]  4. The rare earth based sintered magnet according to claim 2, wherein, the content of R is 25 mass % or more and 35 mass % or less, the content of B is 0.9 mass % or more and 1.1 mass % or less, and the balance is the composition substantially containing T.

			light rare-earth element RL, which is Nd and/or Pr, as a major rare-earth
Expires:			element R is provided. A bulk body 2 including a heavy rare-earth element
September			RH, which is at least one of Dy, Ho and Tb is also provided. The sintered
2030			magnet body 1 and the bulk body 2 are arranged in a processing chamber 4

with a vapor control member 3 interposed between the sintered magnet body 1 and the bulk body 2. And the inside of the processing chamber 4 is heated to a temperature of 700.degree. C. to 1000.degree. C., thereby diffusing the heavy rare-earth element RH inside the sintered magnet body 1 while supplying the heavy rare-earth element RH from the bulk body 2 to the surface of the sintered magnet body 1 via the vapor control member 3.

The invention claimed is:

1. A method for producing [process/method] a sintered R--Fe--B based rareearth magnet, the method comprising the steps of: providing a sintered R--Fe--B based rare-earth magnet body including, as a main phase, crystal grains of an R.sub.2Fe.sub.14B type compound that includes a light rare-earth element RL, which is at least one of Nd and Pr, as a major rare-earth element R; providing a bulk body including a heavy rare-earth element RH, which is at least one element selected from the group consisting of Dy, Ho and Tb; arranging the sintered R--Fe--B based rare-earth magnet body and the bulk body in a processing chamber with a vapor control member interposed between the sintered R--Fe--B based rare-earth magnet body and the bulk body; and heating the inside of the processing chamber to a temperature of 700.degree. C. to 1000.degree. C., thereby diffusing the heavy rare-earth element RH into the sintered R--Fe--B based rare-earth magnet body while supplying the heavy rare-earth element RH from the bulk body to the surface of the sintered R--Fe--B based rare-earth magnet body via the vapor control member, wherein the vapor control member includes: an upper surface and a lower surface; a plurality of openings, which communicate between the upper and lower surfaces; and a wall portion, which defines the openings, and wherein the wall portion has a thickness of 0.5 mm or less, each said opening of the vapor control member has a depth of 1 mm to 10 mm, D/A is equal to or smaller than 8 mm.sup.-1, where each said opening of the vapor control member has an area of A [mm.sup.2] and a depth of D [mm], and in the step of heating, a gap

			between the sintered RFeB based rare-earth magnet body and the vapor control member is set to be within a range of 0 mm to 10 mm, a gap between the vapor control member and the bulk body is set to be within a range of 0 mm to 10 mm, and a gap between the sintered RFeB based rare-earth magnet body and the bulk body is set to be 10 mm or less.

Filed: February	8,821,649	Assignee:	Magnetic material and motor using the same
17, 2011		Hitachi, Ltd.	Abstract
Issued: September 2, 2014  Expires: September 2031		(Tokyo, Japan)	Characteristics of a magnetic material are improved without using a heavy rare earth element as a scarce resource. By incorporating fluorine into a magnetic powder and controlling the crystal orientation in crystal grains, a magnetic material securing magnetic characteristics such as coercive force and residual flux density can be fabricated. As a result, the resource problem with heavy rare earth elements can be solved, and the magnetic material can be applied to magnetic circuits that require a high energy product, including various rotating machines and voice coil motors of hard discs.  What is claimed is:  1. A magnetic material comprising [composition of matter] a main phase comprising fluorine and a magnetic powder, the magnetic powder comprising
			at least one crystal grain having a uniform crystal structure and an angular difference in crystal orientation of 45.degree. or less in average in the crystal structure, wherein the magnetic material is obtained by a fluorination reaction of the magnetic powder at a temperature from 50.degree. to less than 500.degree. C. in an atmosphere of a fluorine-containing gas generated by
			decomposing a member selected from the group consisting of ammonium fluoride, xenon fluoride, ammonium hydrogen fluoride, ammonium acid

fluoride, salts composed of an amine and hydrogen fluoride, and krypton fluoride, wherein the magnetic powder comprises at least two compositions of fluoride; fluorine atoms are disposed at interstitial positions of iron or at interstitial positions of a transition metal element excluding iron and a rare earth element; and the composition formula is represented by: RE.sub.x(Fe.sub.sM.sub.T).sub.YF.sub.Z+RE.sub.U(Fe.sub.SM.sub.T).sub.VF .s- ub.W wherein RE denotes a rare earth element, M denotes a transition metal element excluding iron and a rare earth element, F denotes fluorine, X, Y, Z, S, T, U, V and W are positive numbers, (Fe.sub.sM.sub.T).sub.YF.sub.Z represents a composition of a central portion of the magnetic powder, (Fe.sub.SM.sub.T)F.sub.W represents a composition of a surface of the magnetic powder, X<Y, Z<Y, S>T, U<V, W<V and Z<W, and wherein the compositions of fluoride satisfy X<Y/10, Z<3, Z<Y/4, T<0.4 and S>T; and a volume proportion of a phase other than the main phase comprising fluorides and oxy-fluorides exhibiting no ferromagnetism and having a body-centered tetragonal or hexagonal structure is 0.01 to 10% with respect to the main phase.

- 2. The magnetic material according to claim 1, wherein fluorine atoms are disposed at interstitial positions of a crystal lattice of the magnetic powder; and the magnetic powder has a higher fluorine concentration in a surface of the magnetic powder than in a central portion of the magnetic powder or has a larger crystal lattice in the surface than in the central portion.
- 3. The magnetic material according to claim 1, wherein the magnetic material comprises the main phase further comprising a transition metal element.
- 4. The magnetic material according to claim 3, wherein the transition metal element is at least one selected from the group consisting of Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zr, Nb and Mo.

			5. The magnetic material according to claim 1, wherein the magnetic powder comprises at least two compositions of fluoride; fluorine atoms are disposed at interstitial positions of iron or at interstitial positions of a transition metal element excluding iron and a rare earth element; and the composition formula is represented by: (Fe.sub.SM.sub.T).sub.YF.sub.Z+(Fe.sub.UM.sub.V).sub.WF.sub.X wherein M denotes a transition metal element excluding iron and a rare earth element, F denotes fluorine, (Fe.sub.SM.sub.T).sub.YF.sub.Z represents a composition of a central portion of the magnetic powder, (Fe.sub.UM.sub.V).sub.WF.sub.X represents a composition a surface of the magnetic powder, Z <y, and="" th="" x<w="" z<x.<=""></y,>
			6. The magnetic material according to claim 5, wherein the compositions of fluoride satisfy S>T and U>V.
			7. The magnetic material according to claim 1, wherein the main phase further comprises Re.sub.1Fe.sub.mN.sub.n, wherein Re is a rare earth element, and l, m and n are positive integers; Re.sub.1Fe.sub.mC.sub.n, wherein Re is a rare earth element, and l, m and n are positive integers; Re.sub.1Fe.sub.mB.sub.n, wherein Re is a rare earth element, and l, m and n are positive integers; Re.sub.1Fe.sub.m, wherein Re is a rare earth element, and l and m are positive integers; or M.sub.1Fe.sub.m, wherein M is at least one transition element excluding Fe, Fe is iron, and l and m are positive integers.
			8. The magnetic material according to claim 7, wherein an oxy-fluoride comprising a rare earth element is present in a surface of the crystal grain or the powder of the main phase.

2008		Intermetallics Co., Ltd.	Abstract The objective of the present invention is to provide a method for making a

Issued: August 12, 2014  Expires: April 2028	(Kyoto, Japan)	NdFeB sintered magnet, capable of enhancing the effect of increasing the coercive force and preventing the instability of the effects, and in addition, being inexpensive. The method for making a NdFeB sintered magnet according to the present invention has processes of coating a NdFeB sintered magnet with a powder containing Dy and/or Tb, then heating the NdFeB sintered magnet, and thereby diffusing R.sup.h in the powder into the NdFeB sintered magnet through a grain boundary, and is characterized in that the powder contains 0.5 through 50 weight percent of Al in a metallic state; and the amount of oxygen contained in the NdFeB sintered magnet is equal to or less than 0.4 weight percent.
		The invention claimed is:
		1. A method for making a NdFeB sintered magnet [process/method]: including processes of coating a NdFeB sintered magnet base material compact with a powder containing R.sup.h, [composition of matter], where R.sup.h represents Dy and/or Tb, then heating the NdFeB sintered magnet base material compact, and thereby diffusing R.sup.h in the powder into the NdFeB sintered magnet through a grain boundary, and obtaining a NdFeB sintered magnet that has a coercive force H.sub.c1, value within a range of from 19.0 to 26.9 kOe, wherein: the powder contains 0.5 through 50 weight percent of Al in a metallic state; at least a part of the Al is diffused by the heating through the grain boundary; and an amount of oxygen contained in the NdFeB sintered magnet base material compact is equal to or less than 0.4 weight percent.
		2. The method for making a NdFeB sintered magnet <i>[presumptive process/method]</i> according to claim 1, wherein the amount of oxygen is equal to or less than 0.3 weight percent <i>[composition of matter]</i> .
		3. The method for making <i>[presumptive process/method]</i> a NdFeB sintered magnet according to claim 1, wherein the powder contains a fluoride of

## R.sup.h[composition of matter].

- 4. The method for making *[presumptive process/method]* a NdFeB sintered magnet according to claim 1, wherein the powder contains *[composition of matter]* a powder of an alloy of RR.sup.hT, where R represents one or plural kinds from among rare earth elements other than Dy and Tb, and T represents one or plural kinds from among Fe, Co, and Ni, and/or an alloy of RR.sup.hTB.
- 5. The method for making a NdFeB sintered magnet according to claim 2, wherein the powder contains a fluoride of R.sup.h *[composition of matter]*.
- 6. The method for making *[presumptive process/method]* a NdFeB sintered magnet according to claim 2, wherein the powder contains a powder of an alloy of RR.sup.hT, where R represents one or plural kinds from among rare earth elements other than Dy and Tb, and T represents one or plural kinds from among Fe, Co, and Ni, and/or an alloy of RR.sup.hTB*[composition of matter]*
- 7. The method for making *[presumptive process/method]* a NdFeB sintered magnet according to claim 3, wherein the powder contains a powder of an alloy of RR.sup.hT, where R represents one or plural kinds from among rare earth elements other than Dy and Tb, and T represents one or plural kinds from among Fe, Co, and Ni, and/or an alloy of RR.sup.hTB *[composition of matter]*.
- 8. The method for making *[presumptive process/method]* a NdFeB sintered magnet according to claim 5, wherein the powder contains a powder of an alloy of RR.sup.hT, where R represents one or plural kinds from among rare earth elements other than Dy and Tb, and T represents one or plural kinds from among Fe, Co, and Ni, and/or an alloy of RR.sup.hTB *[composition of*]

			matter].
			9. The method for making <i>[presumptive process/method]</i> a NdFeB sintered magnet according to claim 1, wherein the SQ value of the NdFeB sintered magnet is higher than 80 percent.
Filed:	8,734,714	Assignee:	Magnet recycling
June 27, 2011 Issued: May 27, 2014 Expires: June 2031		The University of Birmingham (Birmingham, Great Britian)	Abstract The present invention discloses a method for recovering rare earth particulate material from an assembly comprising a rare earth magnet and comprises the steps of exposing the assembly to hydrogen gas to effect hydrogen decrepitation of the rare earth magnet to produce a rare earth particulate material, and separating the rare earth particulate material from the rest of the assembly. The invention also resides in an apparatus for separating rare earth particulate material from an assembly comprising a rare earth magnet. The apparatus comprises a reaction vessel having an opening which can be closed to form a gas-tight seal, a separation means for separating the rare earth particulate material from the assembly, and a collection means for collecting the rare earth particulate material. The reaction vessel is connected to a vacuum pump and a gas control system, and the gas control system controls the supply of hydrogen gas to the reaction vessel.  What is claimed is:  1. Apparatus for producing and separating rare earth particulate material from an assembly comprising a rare earth magnet using hydrogen decrepitation, the apparatus comprising: a reaction vessel having an opening which is capable of being closed to form a gas-tight seal; a separator configured to separate the rare
			earth particulate material from the assembly; and a collector configured to collect the rare earth particulate material; wherein the reaction vessel is

			connected to a vacuum pump and a gas control system; wherein the gas control system controls the supply of hydrogen gas to the reaction vessel; and wherein the separator comprises: a porous container located within the reaction vessel and having holes of appropriate size to allow the rare earth particulate material to pass through and to retain the assembly within the container; and a device capable of tumbling the assembly contained within the porous container to facilitate separation of the rare earth particulate material from the assembly and movement of the rare earth particulate material though the holes of the porous container  10. A method [process/method] for using the apparatus of claim 1 to produce and separate rare earth particulate material from the assembly, the method comprising the steps of: providing the assembly within the reaction vessel, using the gas control system, controlling the supply of hydrogen gas to the reaction vessel to expose the assembly to the hydrogen gas to effect hydrogen decrepitation of the rare earth magnet whereby the rare earth particulate material is produced, using the separator, separating the rare earth particulate material from the rest of the assembly, using the collector, collecting the rate earth particulate material and wherein the separating comprises tumbling the assembly.  11. The method according to claim 10, wherein the rare earth magnet is NdFeB or SmCo  Note: gas mixture, temperature and pressure specifications are visible in other claims

Nov 2029		block, and (d) cutting the block in a plane perpendicular to the magnetization direction into a magnet segment having a coercive force distribution on the cut
		section that the coercive force is high at the periphery and lower toward the inside and a constant coercive force distribution in the magnetization direction.
		The invention claimed is:
		1. A method for preparing [process/method] a sintered Nd base magnet
		comprising in the recited order, the steps of: providing a sintered Nd base
		magnet block having surfaces perpendicular to a magnetization direction and
		extending to the magnetization direction; coating the surfaces of the magnet
		block excluding the surface perpendicular to the magnetization direction with a
		Dy or Tb oxide powder, a Dy or Tb fluoride powder, or a Dy or Tb-containing
		alloy powder, thereby obtaining a coated block; heating the coated block so
		that the Dy or Tb in the Dy or Tb oxide powder, the Dy or Tb fluoride powder,
		or the Dy or Tb-containing alloy powder, diffuses into the block; cutting the coated block in a plane perpendicular to the magnetization direction to form a
		cut section into a magnet segment having a coercive force distribution on the
		cut section so that the coercive force is high at a periphery of the cut section
		and lower toward an inside of the cut section and a constant coercive force
		distribution in the magnetization direction; and then machining the magnet
		segment on the surface perpendicular to the magnetization direction so as to
		make a cross-section along the magnetization direction into a C or D shape.
		2. A method for preparing [process/method] a sintered Nd base magnet
		according to claim 1, wherein the magnet block has a maximum dimension of

			up to 100 mm in a Dy or Tb-diffusing direction perpendicular to the magnetization direction and a maximum length of at least 30 mm in the magnetization direction.
Filed: September	8,673,392	Assignee:	Permanent magnet and method of manufacturing same
10, 2007		ULVAC, Inc.	
T1.		(V I)	Abstract
Issued: March 18, 2014  Expires: Sept 2027		(Kanagawa, Japan)	A permanent magnet is provided which has formed a Dy, Tb film on a surface of an iron-boron-rare earth sintered magnet of a predetermined shape, with diffusion thereof into grain boundary phases, having a higher coercive force. The method of manufacturing a permanent magnet includes a film-forming step of evaporating metal evaporating material containing at least one of Dy and Tb and adhering evaporated metal atoms to a surface of the iron-boron-rare earth sintered magnet, and a diffusing step of performing heat treatment to diffuse metal atoms adhered to the surface into grain boundary phases of the sintered magnet. The metal evaporating material contains at least one of Nd and Pr.
			What is claimed is:
			1. A method of manufacturing [process/method] a permanent magnet comprising: a film-forming step comprising: heating a total surface area of a metal evaporating material containing at least one of Dy and Tb in order to evaporate metal atoms of the metal evaporating material from the total surface area of the metal evaporating material; and adhering the evaporated metal atoms to a surface of an iron-boron-rare earth sintered magnet; and a diffusing step of performing heat treatment to diffuse metal atoms adhered to the surface into grain boundary phases of the sinteredmagnet, wherein the metal evaporating material contains at least one of Nd and Pr, and a ratio of a the total surface area of the metal evaporating

			material to a total surface area of the sintered magnet is set to be in a range of 1.times.10.sup4 to 2.times.10.sup.3.  2. The method of manufacturing [process/method] a permanent magnet according to claim 1, wherein the metal evaporating material further comprises at least one material of the group consisting of Ag, B, Ba, Be, C, Ca, Ce, Co, Cr, Cs, Er, Eu, Fe, Gd, Ge, Hf, Ho, In, K, La, Li, Lu, Mg, Mn, Mo, Na, Nb, Ni, P, Pd, Ru, S, Sb, Si, Sm, Sn, Sr, Ta, Ti, Tm, V, W, Y, Yb, Zn, and Zr.

The particles of the magnetic powder have a ratio of a short diameter being 10 .mu.m or more to a long diameter is 0.5 or less. An element Rm having a magnetic anisotropy higher than that of the rare earth element is contained in the surface and inside of the magnet constituted by the magnet powder in an approximately constant concentration. An oxy-fluoride and carbon are present at boundaries of the particles of the magnet powder.
-			What is claimed is:

			1. A rare earth magnet having a composition <i>[composition of matter]</i> represented by RTB wherein R denotes a rare earth element, T a transition metal and B boron, the magnet being composed of particles of magnetic powder constituted by crystalline particles, wherein the particles of the magnetic powder have a flat form in which a ratio of a short diameter to a long diameter is 0.5 or less, wherein an element Rm having a magnetic anisotropy higher than that of the rare earth element is contained in the surface and inside of the magnet constituted by the magnet powder, a concentration of Rm in the surface of the crystalline particles being higher than that of the inside thereof, wherein a size of the crystalline particles in c-axis is 20 to 100 nm, and a size in a direction perpendicular to the c-axis is 100 to 400 nm, and wherein an oxy-fluoride and carbon are present at least at crystal grain boundaries of the particles of the magnet powder
			6. A rare earth magnet having a composition represented by RTB [composition of matter] wherein R denotes a rare earth element, T a transition metal and B boron, wherein the magnet is composed of magnet powder constituted by crystalline particles, wherein the particles of the magnetic powder have a flat form, wherein an oxy-fluoride and carbon are present at least at crystal grain boundaries of the particles of the magnet powder, wherein an element Rm having a magnetic anisotropy higher than that of the rare earth element is contained in the surface and inside of the magnet constituted by the magnet powder, wherein a concentration of Rm in the surface of the magnet powder is higher than inside of the magnet powder, and wherein a size of the crystalline particles in c-axis is 20 to 100 nm, and a size in a direction perpendicular to the c-axis is 100 to 400 nm.
Filed: Feb 7, 2012	8,298,469	Assignee:	Method for manufacturing magnet poles
7, 2012		Siemens	Abstract

Issued:	Aktiengesellschaft	A method for manufacturing sintered magnet poles is described. The mold is
Oct30,		filled with a vitrifiable base material powder and closed with a plate. A
2012	(Germany)	magnetic field aligns the powder and a plate pressed onto the powder
	-	establishes a compact that holds the alignment in place. The compact is
Expires: Feb 2032		sintered to form a sintered magnet pole. The mold forms a protective cover of the sintered magnet pole and the plate forms a base plate of a magnet pole
		piece. Furthermore, a magnet pole piece is provided which has a magnet pole and a base plate which is fixed to a protective cover so that the base plate and
		the protective cover surround the magnet pole. The base plate and/or the protective cover of the magnet pole piece has at least one element that provides
		a geometrical locking of the magnet pole to the base plate and/or the protective cover.
		The invention claimed is:
		1. A method for manufacturing [process/method] sintered magnet poles,
		comprising: providing a mould having a first opening; filling a vitrifiable randomly oriented base material powder into the mould through the first
		opening; closing the first opening with a plate; placing the mould with the
		randomly oriented powder into a magnetic field to align the randomly oriented
		powder into aligned powder; pressing the plate onto the aligned powder to
		establish a compact that holds the alignment of the aligned powder in place;
		sintering the compact while the compact is oriented over the plate inside the
		mould to form a sintered magnet pole that adheres to the plate as a result of the sintering process, wherein a gap is formed between the sintered magnet pole
		and the mould due to shrinkage of the compact during sintering;
		simultaneously pressing the mould inside a die during sintering, wherein the
		mould is initially provided in a rough shape, and wherein the rough shape is
		converted to a final shape as a result of said pressing; quenching and then heat
		treating the sintered magnet pole; fixing the mould to the plate before or after

quenching or heat treatment; introducing a filling material into the gap by

			vacuum injection after fixing the mould to the plate; and using the protective cover and base plate as part of the final product, wherein the mould ultimately forms a protective cover of the sintered magnet pole and the plate ultimately forms a base plate of a magnet pole piece.
Filed: July 23, 2008  Issued: October 30, 2012  Expires: July 2028	8,298,352	Assignee: Vacuumschmelze GmbH & Co. KG (Germany)	Method for the production of magnet cores, magnet core and inductive component with a magnet core  Abstract A magnet core (1) made of a composite of platelet-shaped particles of a thickness D and a binder has a particularly linear relative permeability curve over a pre-magnetised constant field. For this purpose, the platelet-shaped particles (5) are provided with an amorphous volume matrix (8), wherein areas (9) with a crystalline structure having a thickness d of 0.04*D.ltoreq.d.ltoreq.0.25*D and covering a proportion x of x.gtoreq.0.1 of the surface (6, 7) of the particle (5) are embedded on the surface (6, 7) of the particle (5).
			The invention claimed is:  1. A magnet core comprising a <i>[composition of matter]</i> composite of: (a) platelet-shaped particles of a magnetic alloy, each comprising an amorphous volume matrix and two opposing main surfaces which are separated by a thickness D, wherein extending into the amorphous volume matrix from at least one of the surfaces are embedded areas having a crystalline structure, which embedded areas extend into the amorphous volume matrix a thickness d, such that 0.04*D.ltoreq.d.ltoreq.0.25*D and which embedded areas cover a proportion x of the surface of the platelet-shaped particles such that x.gtoreq.0.1; and (b) a binder.

Filed: Oct 27,	8,277,578	Assignee:	Rare earth permanent magnet and its preparation
2010		Shin-Etsu Chemical	Abstract
		Co., Ltd.	A rare earth permanent magnet is prepared by disposing a powdered metal
Issued:			alloy containing at least 70 vol % of an intermetallic compound phase on a
October 2,		(Japan)	sintered body of RFeB system and heating the sintered body having the
2012			powder disposed on its surface below the sintering temperature of the sintered body in vacuum or in an inert gas for diffusion treatment. The advantages
Expires:			include efficient productivity, excellent magnetic performance, a minimal or
Oct 2030			zero amount of Tb or Dy used, an increased coercive force, and a minimized decline of remanence.

## The invention claimed is:

- 1. A rare earth permanent magnet, which is prepared by [process/method] disposing an alloy powder on a surface of an original sintered body of the composition R.sub.a-T.sup.1.sub.b-B.sub.cwherein R is at least one element selected from rare earth elements inclusive of Y and Sc, T.sup.1 is at least one element selected from Fe and Co, B is boron, "a," "b" and "c" indicative of atomic percent are in the range: 12.ltoreq.a.ltoreq.20, 4.0.ltoreq.c7.0, and the balance of b, said alloy powder having the composition M.sup.1.sub.d-M.sup.2.sub.ewherein each of M.sup.1 and M.sup.2is at least one element selected from the group consisting of Al, Si, C, P, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Ge, Zr, Nb, Mo, Ag, In, Sn, Sb, Hf, Ta, W, Pb, and Bi, M.sup.1 is different from M.sup.2, "d" and "e" indicative of atomic percent are in the range: 0.1.ltoreq.e.ltoreq.99.9 and the balance of d, and containing at least 70% by volume of an intermetallic compound phase, and heat treating the sintered body having the alloy powder disposed on its surface at a temperature equal to or below the sintering temperature of the original sintered body in vacuum or in an inert gas, wherein at least one element of M.sup.1 and at least one element of M.sup.2 in the alloy powder is diffused to grain boundaries in the interior of the sintered body and/or near grain boundaries within sintered body primary phase grains, and not into the interior of primary phase grains, so that the coercive force of the magnet is increased over the magnet properties of the original sintered body.
- 2. The rare earth permanent magnet according to claim 1, wherein *[composition of matter]* the at least one element of M.sup.1 and the at least one element of M.sup.2 in the alloy powder is diffused to grain boundaries in the interior of the sintered body and near grain boundaries within sintered body primary phase grains so that the coercive force of the magnet is increased over the magnet properties of the original sintered body.

Expires:			The invention claimed is:
May 2027			1. A method [process/method] for producing an RFeB based porous
			magnet, the method comprising the steps of: providing an RFeB based rare- earth alloy powder with a mean particle size that is less than 10 .mu.m; making
			a powder compact by compacting the RFeB based rare-earth alloy powder; producing hydrogenation and disproportionation reactions by heat-treating the
			powder compact at a temperature of 650.degree. C. to less than 900.degree. C. within a hydrogen gas; producing desorption and recombination reactions by
			heat-treating the powder compact at a temperature of 650.degree. C. to less than about 900.degree. C. within either a vacuum or an inert atmosphere,
			which forms an RFeB based porous magnet that has a density of 3.5
			g/cm.sup.3 to 7.0 g/cm.sup.3 and that has micropores with a major axis of 1 .mu.m to 20 .mu.m; and decreasing a temperature of the RFeB based
			porous magnet to room temperature, which forms the RFeB based porous
			magnet that has a density of 3.5 g/cm.sup.3 to 7.0 g/cm.sup.3 at room temperature
			4. The method of claim 1, wherein the RFeB based rare-earth alloy powder is obtained by pulverizing a rapidly solidified alloy
			8. A method of making an RFeB based magnet powder, the method

			comprising the steps of: making a powder compact by compacting an RFeB based rare-earth alloy powder with a mean particle size that is less than 10 .mu.m; producing hydrogenation and disproportionation reactions by heattreating the powder compact at a temperature of 650.degree. C. to less than 900.degree. C. within a hydrogen gas; producing desorption and recombination reactions and forming an RFeB based porous magnet by heat-treating the powder compact at a temperature of 650.degree. C. to less than about 900.degree. C. within either a vacuum or an inert atmosphere, which forms an RFeB based porous magnet that has a density of 3.5 g/cm.sup.3 to 7.0 g/cm.sup.3 and that has micropores with a major axis of 1 .mu.m to 20 .mu.m; and pulverizing the RFeB based porous magnet
Filed: Dec	8,262,808	Assignee:	Permanent magnet and method of manufacturing same
19, 2007  Issued: Sept 11, 2012  Expires: Dec 2027		ULVAC, Inc. (Japan)	Abstract There is provided a method of manufacturing a permanent magnet which has an extremely high coercive force and high magnetic properties is manufactured at high productivity. There are executed: a first step of causing at least one of Dy and Tb to adhere to at least part of a surface of iron-boron-rare-earth based sintered magnet; and a second step of diffusing, through heat-treatment at a predetermined temperature, at least one of Dy and Tb adhered to the surface of the sintered magnet into grain boundary phase of the sintered magnet. As the sintered magnet, there is used one which is manufactured by: mixing each powder of principal phase alloy (constituted primarily by R.sub.2T.sub.14B phase, where R is at least one rare earth element primarily including Nd and where T is a transition metal primarily including Fe), and a liquid phase alloy (having a higher content of R than R.sub.2T.sub.14B phase and primarily constituted by R-rich phase) in a predetermined mixing ratio; press-forming in magnetic field a mixed powder thus obtained; and sintering a press-formed body in vacuum or inert gas atmosphere

			What is claimed is:
			1. A method of manufacturing <i>[process/method]</i> a permanent magnet comprising: manufacturing an iron-boron-rare-earth based sintered magnet by: mixing a first powder and a second powder in a predetermined mixing ratio into a mixed powder, the first powder comprising a principal phase alloy including an R.sub.2T.sub.14B phase, where R is at least one rare earth element including Nd and where T is a transition metal including Fe, and the second powder comprising a liquid phase alloy including a higher content of R than the R.sub.2T.sub.14B phase of the first powder and a R-rich phase; pressforming the mixed powder oriented in a magnetic field into a press-formed body; and sintering the press-formed body in one of vacuum and inert gas atmosphere providing the manufactured sintered magnet and an evaporating material disposed at a distance from each other; providing, through a vapor atmosphere, the evaporating material comprising at least one of Dy and Tb to at least part of a surface of the sintered magnet; and diffusing, through heattreatment at a first predetermined temperature, the at least one of Dy and Tb adhered to at least part of the surface of the sintered magnet into a grain boundary phase of the sintered magnet, before a thin film made of the evaporating material is formed on the at least part of the surface of the sintered magnet.

20, 2011		Panasonic Corporation	motor
Issued:			
May 22,		(Japan)	Abstract
2012			To improve tranquility and controllability of an iron core-equipped permanent magnet motor with an improved maximum energy product (BH).sub.max by
Expires:			improving shape compatibility of a radial anisotropic magnet, there is provided
Oct 2031			a radial anisotropic magnet manufacturing method of fixing magnet powder in
			a net shape so as to maintain a magnetic anisotropic (C-axis) angle of a magnet
			with respect to a tangential line and for performing a deformation with a flow
			so as to have a predetermined circular arc shape or a predetermined annular
			shape. Particularly, by performing a deformation with a viscous flow or an
			extension flow, a deformability of the magnet is improved, and thus shape
			compatibility with respect to a thickness is. improved. A C-axis angle .theta. with respect to a tangential direction is controlled at an arbitrary position and
			an arbitrary angle so as to reduce cogging torque without separating a magnetic
			pole into segments.
			r
			The invention claimed is:
			1. An iron core-equipped permanent magnet motor comprising [composition of
			matter] an even number of radial anisotropic magnets: wherein the radial
			anisotropic magnets maintain a magnetic anisotropic angle of a magnet with
			respect to a tangential line by fixing magnet powder in a net shape, and have a
			predetermined circular arc shape or a predetermined annular shape by
			performing a deformation with a flow; wherein the pre-deformation magnet is

			a resin composite of which a microstructure includes a magnet powder stationary phase A and a flow phase B, wherein a part of the phase B is chemically coupled to the phase A so as to fix the stationary phase A group in a net shape; wherein the magnet is deformed by a shear flow action and an extension flow action of the phase B; wherein the radial anisotropic magnets are manufactured by (i) manufacturing a deformed magnet including a perpendicular anisotropic part .alphasub.0 having a magnetic anisotropic angle of 90 degree with respect to a tangential line, a non-perpendicular anisotropic part .betasub.0 having a magnetic anisotropic angle .theta. in a range of 0 to 90 degree with respect to the tangential line, and a non-perpendicular anisotropic part .beta'sub.0 having .theta. in a range of 90 to 180 degree; and (ii) deforming the magnet into an annular shape or a circular arc shape so as to form a radial anisotropic part .alphasub.1 corresponding to the perpendicular anisotropic part .alphasub.0, a curved surface .betasub.1 corresponding to the non-perpendicular anisotropic part .betasub.0, and a curved surface .beta'sub.1 corresponding to the non-perpendicular anisotropic part .alphasub.0; and wherein in the post-deformation radial anisotropic part .alphasub.0, the post-deformation curved surface .betasub.1 corresponding to the pre-deformation perpendicular anisotropic part .betasub.0, and the post-deformation curved surface .betasub.1 corresponding to the pre-deformation non-perpendicular anisotropic part .betasub.0, and the post-deformation non-perpendicular anisotropic part .betasub.0, the magnetic anisotropic angles with respect to the tangential line are the same before and after the deformation.

Filed: December 23, 2009	8,157,927	Assignee:  DK Corporation	Raw material alloy for R-T-B system sintered magnet, R-T-B system sintered magnet and production method thereof
Issued: April 17, 2012  Expires: Dec 2029		(Tokyo, JAPAN)	Abstract It is an object of the present invention to obtain a highly coercive R-T-B system sintered magnet by making the crystal microstructure of a raw material alloy prepared by strip casting more uniform, thereby making the crushed powder obtained from such raw material alloy more fine and making the size distribution more narrow. The present invention provides a raw material alloy for an R-T-B system sintered magnet containing grains of an R.sub.2T.sub.14B compound, wherein a P and/or S content is between 100 and 950 ppm. This raw material alloy preferably has a composition comprising 25 to 35% by weight of R, 0.5 to 4% by weight of B, 0.02 to 0.6% of one or both of Al and Cu, 5% by weight or less of Co, and the balance of Fe. What is claimed is:
			1. A method <i>[process/method]</i> for producing an R-T-B sintered magnet, comprising a sintered body having grains comprising an R.sub.2T.sub.14B compound as a main phase, and comprising steps of: strip casting a raw material metal to prepare a raw material alloy having a total of P and S content between 100 and 950 ppm; milling the raw material alloy into a powder having a prescribed particle size; compacting the powder in a magnetic field to

			fabricate a compacted body; and sintering the compacted body to obtain the sintered body having a total of P and S content between 10 and 220 ppm, wherein R represents one or more elements selected from rare earth elements, and T represents one or more elements selected from transition metal elements and comprises Fe, or Fe and Co.

crystals as a main phase. The magnet has a first region, which includes either the heavy rare-earth element R.sub.H in a relatively low concentration or no heavy rare-earth elements R.sub.H at all, and a second region, which includes the heavy rare-earth element R.sub.H in a relatively high concentration. The first and second regions are combined together by going through a sintering process.

The invention claimed is:

- 1. An R-T-B based sintered magnet comprising [composition of matter]: a light rare-earth element R.sub.L, which is at least one of Nd and Pr, a heavy rare-earth element R.sub.H, which is at least one of Dy and Tb, and Nd.sub.2Fe.sub.14B type crystals as a main phase; wherein a first region, which includes the heavy rare-earth element R.sub.H in a first concentration of zero or more heavy rare-earth elements R.sub.H, and a second region, which includes the heavy rare-earth element R.sub.H in a second concentration that is higher than the first concentration, are stacked in layers such that the layers extend across an entire length or width of the R-T-B based sintered magnet; and the first and second regions are sintered and combined together. ....
- 10. A method for producing *[process/method]*an R-T-B based sintered magnet including both a light rare-earth element R.sub.L, which is at least one of Nd and Pr, and a heavy rare-earth element R.sub.H, which is at least one of Dy and Tb, and Nd.sub.2Fe.sub.14B type crystals as a main phase, the method comprising the steps of: providing a first material alloy powder, which includes either the heavy rare-earth element R.sub.H in a relatively low concentration or no heavy rare-earth elements R.sub.H at all, and a second material alloy powder, which includes the heavy rare-earth element R.sub.H in a relatively high concentration; forming a composite compact including a first compact portion made of the first material alloy powder that extends across an entire length or width of the composite compact and a second compact portion

			made of the second material alloy powder that extends across the entire length or width of the composite compact; and sintering the composite compact, thereby making a sintered magnet in which the first and second compact portions have been combined together.
Filed: Dec 19,	8,128,760	Assignee:	Permanent magnet and method of manufacturing same
2007		Ulvac, Inc.	Abstract  Ry aliminating the pages ity of a prior stap for cleaning a sintered magnet
Issued: March 6, 2012 Expires: Dec 2027		(Kanagawa, JAPAN)	By eliminating the necessity of a prior step for cleaning a sintered magnet before adhering Dy and/or Tb to the surface of the sintered magnet S, the productivity of a permanent magnet having diffused Dy and/or Tb into grain boundary phase is improved. Iron-boron-rare earth based sintered magnet (S) disposed in a processing chamber (20) is heated to a predetermined temperature. An evaporating material (V) which is made of a hydride containing at least one of Dy and Tb is disposed in the same or in another processing chamber and is evaporated to cause the evaporated evaporating material to the surface of the sintered magnet. Metal atoms of Dy and/or Tb are diffused into grain boundary phase of the sintered magnet.
			What is claimed is:
			1. A method of manufacturing <i>[process/method]</i> a permanent magnet comprising: heating an iron-boron-rare earth based sintered magnet disposed in a processing chamber to a first predetermined temperature which is from 800.degree. C. to 1050.degree. C.; evaporating an evaporating material disposed in the processing chamber or another processing chamber, the evaporating material comprising a hydride containing at least one of Dy and Tb; causing the evaporated evaporating material to be adhered to a surface of the sintered magnet; and diffusing metal atoms of the at least one of Dy and Tb of the adhered evaporating material into a grain boundary phase of the sintered magnet, before a thin film made of the evaporated material is formed on the

			surface of the sintered magnet, wherein the evaporating and the diffusing are executed substantially simultaneously.

Toom od.		Hitachi Metals, Ltd.	Abstract
Issued:		(Talaaa IADAN)	
March 6, 2012		(Tokyo, JAPAN)	An RFeB based rare-earth alloy powder with a mean particle size of less
2012			than about 20 .mu.m is provided and compacted to make a powder compact.
Evniros			Next, the powder compact is subjected to a heat treatment at a temperature of about 550.degree. C. to less than about 1,000.degree. C. within hydrogen gas,
Expires: Oct 2028			thereby producing hydrogenation and disproportionation reactions (HD
OCI 2028			processes). Then, the powder compact is subjected to another heat treatment at
			a temperature of about 550.degree. C. to less than about 1,000.degree. C.
			within either a vacuum or an inert atmosphere, thereby producing desorption
			and recombination reactions and obtaining a porous material including fine
			crystal grains, of which the density is about 60% to about 90% of their true
			density and which have an average crystal grain size of about 0.01 .mu.m to
			about 2 .mu.m (DR processes). Thereafter, the porous material is subjected to
			yet another heat treatment at a temperature of about 750.degree. C. to less than
			about 1,000.degree. C. within either the vacuum or the inert atmosphere,
			thereby further increasing its density to about 93% or more of their true density
			and making an RFeB based microcrystalline high-density magnet.

			What is claimed is:
			1. A method for producing <i>[process/method]</i> an RFeB based microcrystalline high-density magnet, the method comprising the steps of: (A) providing an RFeB based rare-earth alloy powder, where R is at least one element selected from the group consisting of the rare-earth elements including Y and Sc, with a mean particle size of less than about 20 .mu.m; (B) compacting the RFeB based rare-earth alloy powder to make a powder compact; (C) subjecting the powder compact to a heat treatment at a temperature of about 550.degree. C. to less than 900.degree. C. within hydrogen gas, thereby producing hydrogenation and disproportionation reactions; (D) subjecting the powder compact to another heat treatment at a temperature of about 550.degree. C. to less than 900.degree. C. within either a vacuum or an inert atmosphere, thereby producing desorption and recombination reactions and obtaining a porous material including fine crystal grains, of which a density is about 50% to about 90% of a true density thereof and which have an average crystal grain size of about 0.01 .mu.m to about 2 .mu.m; and (E) subjecting the porous material to yet another heat treatment at a temperature of about 750.degree. C. to less than 900.degree. C. within either the vacuum or the inert atmosphere so that rare-earth-rich phases with areas of 1 .mu.m.sup.2 to 10 .mu.m.sup.2 are formed at a number density of at least 1.6.times.10.sup.4 phases per square millimeter on a cross section that passes through a center portion of the RFeB based microcrystalline high-density magnet, thereby further increasing the density thereof to about 93% or more of the true density thereof without performing any hot pressing process.
Filed: March 8,	8,123,832	Assignee:	R-T-B system sintered magnet
2006		TDK Corporation	Abstract An R-T-B system sintered magnet is provided which achieves both a high

Issued: Feb	(Tokyo, JAPAN)	residual magnetic flux density and a high coercive force. The R-T-B system
28, 2012	, , , , , , , , , , , , , , , , , , ,	sintered magnet comprises main-phase grains 1 each having a core-shell
-, -		structure comprising an inner shell part 2 and an outer shell part 3 surrounding
Expires:		the inner shell part 2, wherein the concentration of the heavy rare earth element
March		in the inner shell part 2 is lower by 10% or more than the concentration of the
2026		heavy rare earth element in the periphery of the outer shell part 3, and
		(L/r).sub.ave falls within a range from 0.03 to 0.40 in the main-phase grains 1
		each comprising the inner shell part 2 and the outer shell part 3, wherein L
		represents the shortest distance from the periphery of the main phase grain 1 to
		the inner shell part 2, r represents the equivalent diameter of the main phase
		grain 1, and (L/r).sub.ave represents the average value of L/r for the main-
		phase grains 1 present in the sintered body and having the core-shell structure
		The invention claimed is:
		1. An R-T-B system sintered magnet comprising [composition of matter] a
		sintered body comprising, as a main phase of the sintered body, grains mainly
		comprising an R.sub.2T.sub.14B compound and comprising at least one of Dy
		and Tb as a heavy rare earth element and at least one of Nd and Pr as a light
		rare earth element, the R-T-B system sintered magnet being characterized in
		that: the sintered body has a composition comprising R: 25 to 37 wt %, B: 0.5
		to 2.0 wt %, Co: 3.0 wt % or less, Al: 0.03 to 0.30 wt %, Cu: 0.01 to 0.15 wt
		%, and the balance: Fe and inevitable impurities, wherein R represents the
		heavy rare earth elements in an amount of 0.1 to 10 wt %; the sintered body comprises the grains each having a core-shell structure consisting of a single
		inner shell part and a single outer shell part surrounding the inner shell part;
		the concentration of the heavy rare earth element in the inner shell part is 20 to
		95% of the concentration of the heavy rare earth element in the periphery of
		the outer shell part; in the grains each comprising the inner shell part and the
		outer shell part, (L/r).sub.ave falls within a range from 0.10 to 0.25; and in a

section thereof, the proportion of the number of the grains each having the

			core-shell structure to the total number of the grains forming the sintered body is 20% or more; wherein: R represents one or more rare earth elements inclusive of Y; T represents one or more transition metal elements wherein Fe or Fe and Co are essential; L represents the shortest distance from the periphery of the grain to the inner shell part; r represents the equivalent diameter of the grain; and (L/r).sub.ave represents the average value of L/r for the grains, present in the sintered body, having the core-shell structure.

Filed:	8,105,466	Assignee:	Biased pulse DC reactive sputtering of oxide films
July 27, 2005		SpringWorks, LLC	Abstract
			A biased pulse DC reactor for sputtering of oxide films is presented. The
Issued: January 31, 2012  Expires: July 2025		(Minnetonka, MN, USA)	biased pulse DC reactor couples pulsed DC at a particular frequency to the target through a filter which filters out the effects of a bias power applied to the substrate, protecting the pulsed DC power supply. Films deposited utilizing the reactor have controllable material properties such as the index of refraction. Optical components such as waveguide amplifiers and multiplexers can be fabricated using processes performed on a reactor according to the present invention.
			We claim:
			1. A method of depositing a film on a substrate <i>[process/method]</i> , comprising: providing a process gas between a target and a substrate; providing an RF bias at a bias frequency to the substrate; providing pulsed DC power to the target so that a target voltage alternates between positive and negative voltages; and filtering the pulsed DC power through a narrow band-rejection filter that rejects power in a narrow band around the bias frequency and passes power at

			frequencies above and below the bias frequency; and wherein a material related to the target is deposited on the substrate by exposure of the substrate to the plasma; wherein the RF biased power is a 2 MHz power supply and the bias frequency is 2 MHz; and further wherein the narrow band is 100 kHz and the narrow band-rejection filter is a filter that rejects power at 2 MHz and has a 100 kHz bandwidth.  The target can be a metallic target made of a material to be deposited on the substrate. In some embodiments, the metallic target is formed from Al, Si and various rare-earth ions. A target with an erbium concentration, for example, can be utilized to deposit a film that can be formed into a waveguide optical amplifier  9. The method of claim 6 wherein the alloyed target includes one or more elements taken from a set consisting of Si, Al, Er, Yb, Zn, Ga, Ge, P, As, Sn, Sb, Pb, Ag, Au, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Th, Dy Ho, Tm, and Lu.

Issued:			Abstract
Dec 13,		(Kanagawa, JAPAN)	The object of the present invention is to improve the productivity of a
2011			permanent magnet and to manufacture it at a low cost by effectively coating Dy and Tb on a surface of the magnet of FeB-rare earth elements having a
Expires:			predetermined configuration. The permanent magnet of the present invention is
Feb 2030			manufactured by a coating step for coating Dy on the surface of the magnet of

Fe--B-rare earth elements having a predetermined configuration and a diffusing step for diffusing Dy coated on the surface of the magnet into crystal grain boundary phases of the magnet with being heat treated at a predetermined temperature. In this case, the coating step comprises a first step for heating a process chamber used for carrying out the coating step and generating metallic vapor atmosphere within the process chamber by vaporizing vaporizable metallic material previously arranged within the process chamber, and a second step for introducing into the process chamber the magnet held at a temperature lower than that within the process chamber and then selectively depositing the vaporizable metallic material on a surface of the magnet by an effect of temperature difference between the temperature within the process chamber and that of the magnet by the magnet reaches a predetermined temperature.

## What is claimed is:

1. A method for manufacturing *[process/method]* a permanent magnet, the method comprising the steps of: coating a vaporizable metallic material including at least one of Dy and Tb onto a surface of a magnet of Fe--B-rare earth elements having a predetermined configuration; and diffusing the vaporizable metallic material coated onto the surface of the magnet into crystal grain boundary phases of the magnet by heat treating the vaporizable metallic material at a first predetermined temperature, wherein the coating step comprises: a first step for heating a process chamber to the first predetermined temperature used for carrying out the coating step and generating metallic vapor atmosphere within the process chamber by vaporizing the vaporizable metallic material previously arranged within the process chamber; and a second step for introducing into the process chamber the magnet held at a second predetermined temperature that is lower than the first predetermined temperature within the process chamber and selectively depositing the vaporizable metallic material onto the surface of the magnet by an effect of a

			temperature difference between the first predetermined temperature within the process chamber and the second predetermined temperature of the magnet until the magnet heats up and reaches a third predetermined temperature.

			Co, Ni, Cu, Zn, Nb, Mo, Al, and Zr; I is N alone or a combination of N and C;
			0.01.ltoreqalphaltoreq.0.30; 7.ltoreq.x.ltoreq.12, 0.01.ltoreq.y.ltoreq.8.0, 6.ltoreq.z.ltoreq.14.4, and which anisotropic rare earth hard magnetic material
			is crystallized in a Th.sub.2Zn.sub.17-type structure, of which crystalline
			grains are in a flake shape with a gain size ranging from 1 to 5 .mu.m, and c-
			axis of the crystalline grains, an easy magnetization direction, being oriented

along the minor axis of the flake crystalline grains. The disclosure also provides a process for producing the powdery rare earth anisotropic hard magnetic material and a process for producing anisotropic calender flexible magnet.

## I claim:

- 1. An anisotropic rare earth hard magnetic material, which has, on atomic percent basis, a composition of *[composition of matter]* (Sm.sub.1-.alpha.R.sub..alpha.).sub.xFe.sub.100-x-y-zM.sub.yI.sub.z wherein: R is Pr alone or a combination of Pr with at least one rare earth element selected from the group consisting of La, Ce, Nd, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu and Y; M is at least one element selected from the group consisting of Si, Ti, V, Cr, Mn, Co, Ni, Cu, Zn, Nb, Mo, Al, and Zr; I is N alone or a combination of N and C; 0.01.ltoreq..alpha..ltoreq.0.30; 7.ltoreq.x.ltoreq.12; 0.01.ltoreq.y.ltoreq.8.0; and 6.ltoreq.z.ltoreq.14.4; and the anisotropic rare earth hard magnetic material comprises monocrystal particles having a Th.sub.2Zn.sub.17-structure, of which crystalline grains are in a flake shape with a grain size ranging from 1 to 3 .mu.m, and an easy magnetization direction of the crystalline grains being oriented along a minor axis of the flake crystalline grains.....
- 6. A process for producing *[process/method]* the anisotropic rare earth hard magnetic material according to claim 1, comprising the steps of: (1) preparing a master alloy with all components of (Sm.sub.1-.alpha.R.sub..alpha.).sub.xFe.sub.100-x-y-zM.sub.yI.sub.z except for N by using strip-casting technique, (2) treating the master alloy obtained in step (1) in nitrogen atmosphere at 450-600.degree. C. for 4-8 hours to carry out a gassolid phase reaction, to form a nitride having the composition of (Sm.sub.1-.alpha.R.sub..alpha.).sub.xFe.sub.100-x-y-zM.sub.yI.sub.z as defined in claim 1; and (3) pulverizing the nitride obtained in step (2) into an anisotropic monocrystal powder having an average particle size of 1-3 .mu.m and being in

			a flake shape.
Filed: May 17, 2010	7,988,797	Assignee: Hitachi Metals, Ltd.	Nano-composite magnet, quenched alloy for nano-composite magnet, and method for producing them and method for distinguishing them  Abstract
Issued: Aug 2, 2011 Expires: May 2030		(Tokyo, JAPAN)	A nanocomposite magnet according to the present invention has a composition represented by the general formula: R.sub.xQ.sub.yM.sub.z(Fe.sub.1-mT.sub.m).sub.bal, where R is at least one rare-earth element, Q is at least one element selected from the group consisting of B and C, M is at least one metal element that is selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Cu, Zn, Ga, Zr, Nb, Mo, Ag, Hf, Ta, W, Pt, Au and Pb and that always includes Ti, and T is at least one element selected from the group consisting of Co and Ni. The mole fractions x, y, z and m satisfy the inequalities of 6 at %.ltoreq.x<10 at %, 10 at %.ltoreq.y.ltoreq.17 at %, 0.5 at %.ltoreq.z.ltoreq.6 at % and 0.ltoreq.m.ltoreq.0.5, respectively. The nanocomposite magnet includes a hard magnetic phase and a soft magnetic phase that are magnetically coupled together. The hard magnetic phase is made of an R.sub.2Fe.sub.14B-type compound, and the soft magnetic phase includes an .alphaFe phase and a crystalline phase with a Curie temperature of 610.degree. C. to 700.degree. C. (.omega. phase) as its main phases.  What is claimed is:  1. A nanocomposite magnet having a composition [composition of matter] represented by the general formula: R.sub.xQ.sub.yM.sub.z(Fe.sub.1-mT.sub.m).sub.bal, where R is at least one rare-earth element, Q is at least one element selected from the group consisting of B and C, M is at least one metal element that is selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Cu, Zn, Ga, Zr, Nb, Mo, Ag, Hf, Ta, W, Pt, Au and Pb and that always includes Ti, T is at least one element selected from the group consisting of Co and Ni, and

			the mole fractions x, y, z and m satisfy the inequalities of 6 at %.ltoreq.x<10 at %, 10 at %.ltoreq.y.ltoreq.17 at %, 0.5 at %.ltoreq.z.ltoreq.6 at % and 0.ltoreq.m.ltoreq.0.5, respectively, the nanocomposite magnet including a hard magnetic phase and a soft magnetic phase that are magnetically coupled together, wherein the hard magnetic phase is made of an R.sub.2Fe.sub.14B-type compound, and wherein the soft magnetic phase includes an .alphaFe phase and an Fe.sub.2B phase as its main phases
			3. A rapidly solidified <i>[process/method]</i> alloy to make a nanocomposite magnet, the alloy having a composition represented by the general formula: R.sub.xQ.sub.yM.sub.z(Fe.sub.1-mT.sub.m).sub.bal, where R is at least one rare-earth element, Q is at least one element selected from the group consisting of B and C, M is at least one metal element that is selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Cu, Zn, Ga, Zr, Nb, Mo, Ag, Hf, Ta, W, Pt, Au and Pb and that always includes Ti, T is at T is at least one element selected from the group consisting of Co and Ni, and the mole fractions x, y, z and m satisfy the inequalities of 6 at %.ltoreq.x<10 at %, 10 at %.ltoreq.y.ltoreq.17 at %, 0.5 at %.ltoreq.z.ltoreq.6 at % and 0.ltoreq.m.ltoreq.0.5, respectively, wherein the rapidly solidified alloy includes an R.sub.2Fe.sub.14B-type compound, an .alphaFe phase and an Fe.sub.2B phase.

2010		Co., Ltd.	A rare earth permanent magnet is prepared by disposing a powdered metal
Issued:		00, 210.	alloy containing at least 70 vol % of an intermetallic compound phase on a
July 26,		(Tokyo, JAPAN)	sintered body of RFeB system, and heating the sintered body having the
2011			powder disposed on its surface below the sintering temperature of the sintered
г .			body in vacuum or in an inert gas for diffusion treatment. The advantages
Expires: Oct 2030			include efficient productivity, excellent magnetic performance, a minimal or zero amount of Tb or Dy used, an increased coercive force, and a minimized decline of remanence.

			The invention claimed is:
			1. A method for preparing <i>[process/method]</i> a rare earth permanent magnet, comprising the steps of: disposing an alloy powder on a surface of a sintered body of the composition R.sub.a-T.sup.1.sub.b-B.sub.c wherein R is at least one element selected from rare earth elements inclusive of Y and Sc, T.sup.1 is at least one element selected from Fe and Co, B is boron, "a," "b" and "c" indicative of atomic percent are in the range: 12.ltoreq.a.ltoreq.20, 4.0.ltoreq.c.ltoreq.7.0, and the balance of b, said alloy powder having the composition M.sup.1.sub.d-M.sup.2.sub.e wherein each of M.sup.1 and M.sup.2 is at least one element selected from the group consisting of Al, Si, C, P, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Ge, Zr, Nb, Mo, Ag, In, Sn, Sb, Hf, Ta, W, Pb, and Bi, M.sup.1 is different from M.sup.2, "d" and "e" indicative of atomic percent are in the range: 0.1.ltoreq.e.ltoreq.99.9 and the balance of d, and containing at least 70% by volume of an intermetallic compound phase, and heat treating the sintered body having the powder disposed on its surface at a temperature equal to or below the sintering temperature of the sintered body in vacuum or in an inert gas, for causing at least one element of M.sup.1 and M.sup.2 in the powder to diffuse to grain boundaries in the interior of the sintered body and/or near grain boundaries within sintered body primary phase grains.

		GmbH & Co. KG	Abstract
Issued:			Disclosed herein is a method for the production of an anisotropic magnetic
July 5, 2011		(Hanau, GERMANY)	powder or a magnet produced from said powder, wherein a hydrogenating and dehydrogenating method is applied to the starting material in order to produce the powder. An anisotropic oriented magnetic material, more particularly
Expires:			magnetic scrap metal, is advantageously used as starting material so that the
Nov 2023			complicated use of a molten mass with isotropic distribution of the c axes of
			the hard metal crystals is not required. The result is an anisotropic material having a fine grain structure and a crystallographic orientation matching a TM.sub.XB phase formed during hydrogenation.
			The invention claimed is:

			1. A method for producing [process/method] an anisotropic magnetic powder, comprising: providing a starting material comprising an SE-TM-B alloy, wherein SE is a rare earth element and TM is a transition metal, said starting material comprising a magnetic material with an anisotropic orientation and an average grain size of less than 0.1 mm, said starting material further comprising a hard magnetic content greater than 90% by volume, foreign phases smaller than 0.5 mm in size, and a crystal size and article size such that the crystal size is at most 75% of the particle size; producing a mixture comprising a TM.sub.XB phase in said starting material by a hydrogenation/dehydrogenation treatment without homogenization treatment at high temperate comprising: a first hydrogenation comprising heating said starting material comprising said SE-TM-B alloy under a hydrogen pressure sufficient to produce a hydride of the SE-TM-B alloy, and then a second hydrogenation comprising exposing the hydride resulting from said first hydrogenation to a hydrogen pressure and an elevated temperature sufficient to induce a phase transition to produce said TM.sub.XB phase, and afterward dehydrogenating and producing a reverse phase transition to produce an anisotropic magnetic powder having a crystallographic orientation that matches a crystallographic orientation of said TM.sub.XB phase and that has a fine and uniformly granular microstructure.

		bononies rare earn anoy powder and a sort magnetic material powder, (B)

			compressing the rapidly solidified rare-earth alloy powder and the soft magnetic material powder by a cold process at a temperature of 100.degree. C. or less and under a pressure of 500 MPa to 2,500 MPa, thereby making a compact in which these two powders are joined together; and (C) subjecting the compressed and combined compact to a heat treatment process at a temperature of 350.degree. C. to 800.degree. C.
Filed: Nov 20,	<u>7,927,501</u>	Assignee:	Rare earth element magnet and method of manufacturing same
Issued: April 19, 2011  Expires: Nov 2027		Hitachi, Ltd. (Tokyo, JAPAN)	Abstract A magnet comprising magnetic powder containing at least one rare earth metal element, and an oxide binder for binding the magnetic powder, wherein an inter-face distance of the binder determined by diffraction analysis is 0.25 to 2.94 nm. The disclosure also discloses a method of manufacturing a magnet comprising; compacting magnetic powder containing at least one rare earth element under pressure in a mold; impregnating the compacted magnetic powder molding with a precursor solution of an oxide material; and heattreating the compacted magnetic molding impregnated with the precursor thereby to impart an inter-face distance determined by diffraction analysis to the binder in the compacted molding. The distance is 0.25 to 2.94 nm.  What is claimed is:
			1. A magnet comprising <i>[composition of matter]</i> magnetic powder containing at least one rare earth metal element, the magnetic powder being composed of particles each constituted by fine crystals having an average size of 10 to 100 nm, and an amorphous binder for binding the magnetic powder, wherein an inter-face distance of the binder determined by diffraction analysis is 0.25 to 2.94 nm, the magnet being compact-molded  12. A method of manufacturing <i>[process/method]</i> a magnet comprising:

			compacting magnetic powder containing at least one rare earth element under pressure in a mold; impregnating the compacted magnetic powder molding with a precursor solution containing a precursor of an amorphous binder; and heat-treating the compacted magnetic molding impregnated with the precursor thereby to form fine crystals having a mean size of 10 to 100 nm and to form an inter-face distance of the binder determined by diffraction analysis to the binder in the compacted magnetic powder molding, the distance being 0.25 to 2.94 nm.
			According to embodiments of the present invention, it is possible to improve magnetic properties of magnets that use a binder for bonding the magnetic material powder. The magnet is manufactured by compacting the magnetic powder, without sintering the magnetic powder

Issued: March 29, 2011  Expires: March 2027		(Tokyo, JAPAN)	The object of the present invention is to both reduce costs and improve magnetic characteristics of rare-earth bond magnets in which magnetic material is bound with a binding agent. In order to achieve this object, magnetic characteristics of a magnet are improved by performing cold forming on rare-earth magnetic powder by itself with no resin added. Then, in order to provide strength for the magnet, a low-viscosity SiO.sub.2 precursor is infiltrated and thermoset in the magnet shaped body. As a result, it is possible to obtain a rare-earth bond magnet in which magnetic characteristics are improved and costs are reduced.
			The invention claimed is:
			1. A rare-earth magnet comprising <i>[composition of matter]</i> a rare-earth magnetic powder bound with a SiO.sub.2 binding agent containing an alkoxy group.

T 1		(T. 1. LADAN)	The object of the present invention is to provide a rare earth magnet which
Issued: Jan 18,		(Tokyo, JAPAN)	enables to achieve a good balance between high coercive force and high residual magnetic flux density, and its manufacturing method. The present
2011			invention provides a rare earth magnet in which a layered grain boundary phase is formed on a surface or a potion of a grain boundary of

Expires: Aug 2029			Nd.sub.2Fe.sub.14B which is a main phase of an RFeB (R is a rare-earth element) based magnet, and wherein the grain boundary phase contains a fluoride compound, and wherein a thickness of the fluoride compound is 10 .mu.m or less, or a thickness of the fluoride compound is from 0.1 .mu.m to 10 .mu.m, and wherein the coverage of the fluoride compound over a main phase particle is 50% or more on average. Moreover, after layering fluoride compound powder, which is formed in plate-like shape, in the grain boundary phase, the rare earth magnet is manufactured by quenching the layered compound after melting it at a vacuum atmosphere at a predetermined temperature, or by heating and pressing the main phase and the fluoride compound to make the fluoride compound into a layered fluoride compound along the grain boundary phase.  What is claims is:  1. A rare-earth magnet in which <i>[composition of matter]</i> a layered grain boundary phase, having an average thickness of 1-100 nm, is formed in a coverage of 50% or more on a portion of a grain boundary of Nd.sub.2Fe.sub.14B which is a main phase of an RFeB (R; rare-earth element) based magnet, wherein the grain boundary phase contains at least one
			fluoride compound, and wherein the at least one fluoride compound of the grain boundary phase contains plural rare-earth elements and iron.

Filed: Aug 9,	7,785,460	Assignee:	Method for producing rare earth metal-based permanent magnet having copper plating film on the surface thereof
2005		Hitachi Metals, Ltd.	plating film on the surface thereof
			Abstract
Issued: Aug 31, 2010 Expires: Aug 2025		(Tokyo, JAPAN)	[Problems] To provide a method for producing a rare earth metal-based permanent magnet having on the surface thereof a copper plating film by using a novel plating solution for use in a copper electroplating treatment capable of forming a copper plating film having excellent adhesiveness on the surface of a rare earth metal-based permanent magnet. [Means for Resolution] The method for producing a rare earth metal-based permanent magnet having a copper plating film on the surface thereof according to the invention is characterized in that it comprises forming a copper plating film on the surface of a rare earth metal-based permanent magnet by means of a copper electroplating treatment by using a plating solution having its pH adjusted to a range from 9.0 to 11.5 and containing at least the following three components: (1) Cu.sup.2+ ions, (2) a chelating agent having a chelate stability constant of 10.0 or higher for Cu.sup.2+ ions, and (3) a chelating agent having a chelate stability constant of 16.0 or higher for Fe.sup.3+ ions (where, the aforementioned chelate stability constants are confined to conditions of pH 9.0 to 11.5). The invention claimed is:

			1. A method for producing <i>[process/method]</i> a rare earth metal-based permanent magnet having a copper plating film on the surface thereof, characterized in that it comprises forming a copper plating film on the surface of a rare earth metal-based permanent magnet by means of a copper electroplating treatment by using a plating solution having its pH adjusted to a range from 9.0 to 11.5 and containing at least the following three components: (1) Cu.sup.2+ ions, (2) a chelating agent having a chelate stability constant of 10.0 or higher for Cu.sup.2+ ions at pH of 9.0 to 11.5, and (3) a chelating agent having a chelate stability constant of 16.0 or higher for Fe.sup.3+ ions at pH of 9.0 to 11.5.
Filed:	7,758,767	Assignee:	Oxide magnetic material and sintered magnet

2005		TDK Corporation	Abstract
Issued: June 22, 2010 Expires: Nov 2025		(Tokyo, JAPAN)	The present invention provides a technique to improve an adhesion strength between a magnet main body and a protective film. The rare earth sintered magnet of the present invention comprises a magnet main body of a sintered body containing a rare earth element and a protective film formed on the magnet main body, wherein the ratio of a 10-point average surface roughness Rz of the magnet main body on which the protective film is formed to a mean grain size D50 in the magnet main body (Rz/D50 ratio) is kept in a range from 0.20 to 10.00, inclusive. This gives the rare earth sintered magnet which is coated with the protective film having a high adhesion strength of 100 N/m or more and exhibits high corrosion resistance. The invention claimed is:
			1. A rare earth sintered magnet comprising <i>[composition of matter]</i> a magnet main body of a sintered body containing a rare earth element and a protective film formed on the magnet main body, characterized in that the ratio of a 10-point average surface roughness Rz of the magnet main body on which the protective film is formed to a mean grain size D50 in the magnet main body (Rz/D50 ratio) is in a range from 0.20 to 0.81 inclusive, the D50 is 2.0 to 15.0 .mu.m, and the Rz is 1.5 to 11 .mu.m, the rare earth sintered magnet is an R-T-B system sintered magnet, and the protective film has an adhesion strength of 100 N/m or more.

March			earth sintered magnet, and that are pulverized into powder compactable into a
2025			product with a controlled shrink ratio, and alloy flakes for a rare earth sintered magnet obtained by the method, and a rare earth sintered magnet having
			excellent magnetic properties. The present method includes preparing an alloy melt of a composition consisting of R of rare earth metal elements and the

balance M including B and Fe, and supplying and solidifying the alloy melt on a cooling roll, wherein the roll has on its surface linear nucleation inhibiting portions for inhibiting formation of dendrites or the like, and nucleating portions for formation of the dendrites, and wherein the inhibiting portions have a region with a width of more than 100 .mu.m.

## What is claimed is:

- 1. A method for producing alloy flakes [process/method] for a rare earth sintered magnet, said alloy flakes having a structure containing an R-rich region and dendrites of an R.sub.2Fe.sub.14B phase with a dendrite content of not less than 80 vol %, said method comprising the steps of: (A) preparing an alloy melt of a composition consisting of: at least one element R selected from the group consisting of rare earth metal elements including yttrium, boron, and at least one element M selected from the group consisting of transition metals, silicon, carbon, and mixtures thereof, with iron being essential, (B) supplying and solidifying said alloy melt prepared in step (A) on a cooling roll under such conditions as to generate an alloy structure having an R-rich region and dendrites of an R.sub.2Fe.sub.14B phase with a dendrite content of not less than 80 vol %, and an average size of crystal grains including said R-rich region and said dendrites of the R.sub.2Fe.sub.14B phase of not smaller than 40 .mu.m, wherein said cooling roll has on its roll surface a plurality of linear nucleation inhibiting portions for inhibiting formation of dendrites of a R.sub.2Fe.sub.14B phase and chill crystals, and a plurality of nucleating portions for formation of said dendrites, and wherein said nucleation inhibiting portions have a region with a width of more than 100 .mu.m.
- 9. Alloy flakes for a rare earth sintered magnet obtained by the method of claim 1, comprising *[composition of matter]* at least one element R selected from the group consisting of rare earth metal elements including yttrium, boron, and at least one element M selected from the group consisting of

			transition metals, silicon, carbon, and mixtures thereof, with iron being essential, and having an alloy structure containing an R-rich region and dendrites of a R.sub.2Fe.sub.14B phase, with a dendrite content of not lower than 80 vol % and a chill crystal content of not higher than 1 vol %, wherein an average size of crystal grains including said R-rich region and said dendrites of the R.sub.2Fe.sub.14B phase in the alloy structure is not smaller than 40 .mu.m.

Aug 11, 2009		Disclosed is a rare earth magnet in the RTB (rare earth element-transition metal-boron) system that is made from an improved composition and properties of main phase alloy in the RTB system containing Pr and a
Expires: July 2027		boundary alloy. Disclosed also is a manufacturing method of the rare earth magnet alloy flake by a strip casting method with improved rotating rollers such that the alloy flake has a specified fine surface roughness and has a small and regulated amount of fine R-rich phase regions. Consequently, the alloy flake for the rare earth magnet does not containing .alphaFe and has a homogeneous morphology so that the rare earth magnet formed by sintering or bonding the alloy flakes exhibits excellent magnetic properties. What is claimed is:
		1. A method for producing a rare-earth-containing alloy flake <i>[process/method]</i> including a strip casting method, comprising pouring molten metal onto a rotating roller for casting to solidify the metal, the roller having, on the cast surface, a plurality of elongated raised/dented segments and having a surface roughness provided by a plurality of elongated raised/dented segments, as represented by 10-point average roughness (Rz), falling within a range of 3 .mu.m to 60 .mu.m, wherein 30% or more of raised/dented segments among entire elongated raised/dented segments extend in a direction forming an angle of 45.degree. or more to a roller rotation direction, and removing the metal from the rotating roller to obtain the alloy flake
		4. A method for producing a rare-earth-containing alloy flake according to claim 1, wherein the rare-earth-containing alloy flake comprises <i>[composition of matter]</i> an RTB alloy (R represents at least one rare earth element including Y; T represents transition metals including Fe as an essential element; and B represents boron) which serves as a raw material for producing

a rare earth magnet in the production of the rare-earth-containing alloy flake by

			the strip casting method.
Filed: Jan 12,	7,569,114	Assignee:	Rare-earth magnet and manufacturing method thereof and magnet motor
2007		Hitachi, Ltd.	Abstract The object of the present invention is to provide a rare earth magnet which
Issued: Aug 4, 2009 Expires: Jan 2027		(Tokyo, JAPAN)	enables to achieve a good balance between high coercive force and high residual magnetic flux density, and its manufacturing method. The present invention provides a rare earth magnet in which a layered grain boundary phase is formed on a surface or a portion of a grain boundary of Nd.sub.2Fe.sub.14B which is a main phase of an RFeB (R is a rare-earth element) based magnet, and wherein the grain boundary phase contains a fluoride compound, and wherein a thickness of the fluoride compound is 10 .mu.m or less, or a thickness of the fluoride compound over a main phase particle is 50% or more on average of the fluoride compound over a main phase particle is 50% or more on average. Moreover, after layering fluoride compound powder, which is formed in plate-like shape, in the grain boundary phase, the rare earth magnet is manufactured by quenching the layered compound after melting it at a vacuum atmosphere at a predetermined temperature, or by heating and pressing the main phase and the fluoride compound along the grain boundary phase.
			What is claimed is:
			1. A magnet comprising <i>[composition of matter]</i> : NdFeB based magnetic powder; and a fluoride film formed on a portion or whole of a surface of said magnetic powder, wherein said fluoride film is mainly composed of at least one compound selected from the group consisting of TbF.sub.3 and DyF.sub.3, wherein said magnetic powder has an average particle size of 1 to 100 .mu.m, wherein a rare earth rich phase is formed on a surface of the magnetic powder,

			and said fluoride film is formed on an outer side of said rare earth rich phase, and wherein said fluoride film has a thickness of 1 to 100 nm on average.  9. A magnet motor, including a rotor which has a magnet, wherein the magnet comprises: NdFeB based magnetic powder; and a fluoride film formed on a portion or whole of a surface of said magnetic powder, wherein said fluoride film is mainly composed of at least one compound selected from the group consisting of TbF.sub.3 and DyF.sub.3, wherein said magnetic powder has an average particle size of 1 to 100 .mu.m, and said fluoride film has a thickness of 1 to 100 .mu.m on average.

			Abstract
Issued:		(Sendai-Shi, JAPAN)	A viscous material (4) is obtained by mixing an alloy magnetic powder,
May 12, 2009			magnetized in advance, with a resin. The viscous material (4) thus obtained is applied to an upper surface of a center magnetic leg of an E-shaped core (2). A
F:			coil (3) and an I-shaped core are coupled to the E-shaped core (2). An
Expires: Sept 2023			orientation magnetic field is applied by a permanent magnet (5) while the resin is hardened. As a consequence, a bond magnet is obtained which is formed in tight contact with both of a pair of surfaces defining a magnetic gap between the E-shaped core (2) and the I-shaped core.
			The invention claimed is:
			1. A method of manufacturing a bond magnet <i>[process/method]</i> , wherein: an alloy magnetic powder magnetized in advance by applying a magnetic field ranging from 5 T to 10 T is mixed with a resin at a weight ratio within a range from 70:30 to 97:3 to obtain a viscous material with 10 poises or more, the viscous material is located at a predetermined position of a magnetic device in contact therewith, and a magnetic field ranging from 30 mT to 500 mT is applied to the viscous material to magnetically orient the alloy magnetic powder included in the viscous material while the resin is hardened.  4. The method of manufacturing a bond magnet according to claim 1, wherein as the alloy magnetic powder, a rare earth magnetic powder having a coercive force not smaller than 5 kOe, a Curie temperature not lower than 300.degree. C., and an average particle size of 2.0 to 50 .mu.m is used.

(Nagoya, JAPAN)	Isotropic powdery magnet material, process for preparing and resin-bonded magnet  Abstract Disclosed is an isotropic SmFeN powdery magnet material for producing resin-bonded magnets. The magnet powder is prepared by melt-spinning of a molten alloy and nitriding the alloy powder thus obtained to form a magnet alloy having an alloy composition of one of the formulae, by atomic %:
Expires: Jan 2024			Sm.sub.xFe.sub.100-x-vN.sub.v, Sm.sub.xFe.sub.100-x-y-vM.sup.1.sub.yN.sub.v and Sm.sub.xFe.sub.100-x-z-vM.sup.2.sub.zN.sub.v wherein M.sup.1 is at least one member selected from the group consisting of Hf and Zr; and M.sup.2 is at least one member selected from the group consisting of Si, Nb, Ti, Ga, Al, Ta and C; 7.ltoreq.x.ltoreq.12, 0.1.ltoreq.y.ltoreq.1.5, 0.1.ltoreq.z.ltoreq.1.0 and 0.5.ltoreq.v.ltoreq.20; the crystal structure is TbCu.sub.7 type; and the thickness of the flakes is 10-40 .mu.m.  The invention claimed is:
			1. A flaky, isotropic SmFeN powdery magnet material <i>[composition of matter]</i> prepared by roll-quenching a molten alloy and nitriding the alloy powder thus obtained to form a magnet alloy; the magnet alloy consisting of an alloy composition of the formula, by atomic %: Sm.sub.xCe.sub.aFe.sub.100-x-vCo.sub.bN.sub.v wherein 7.1.ltoreq.x.ltoreq.12 and 0.5.ltoreq.v.ltoreq.20, a TbCu.sub.7 crystal structure, and flakes with a thickness is 10-40 .mu.m. wherein a=0.3 at. % of the alloy composition up to 30 at. % of Sm, and b=2.0 at. % of the alloy composition up to 35 at. % of Fe, and wherein the magnet alloy has an intrinsic coercive force (iHc) of 7 kOe higher.
Filed:	7,479,252	Assignee:	Method for manufacturing throwaway tip and apparatus for aligning green compact

rch 26,		Mitsubishi Materials	
2004		Corp	Abstract
Issued: January 20, 2009  Expires; March 2024		(Tokyo, JAPAN)	A method for manufacturing a throwaway tip is presented in which a green compact Q obtained by press-forming raw material powder for the throwaway tip is placed and sintered on a sintering plate. The green compact Q is press-formed so that the density of the raw material powder is gradually decreased toward a predetermined direction R, and the direction R is oriented substantially toward the outer circumference of the sintering plate 8 in plan view. Thus, it is possible to obtain a throwaway tip having sintering accuracy.
			What is claimed is:
			1. A method of simultaneously making a plurality of sintered articles f[process/method] or throwaway tips of an accuracy of at least M-grade accuracy from green compacts, said method comprising the steps of: filling raw material powder into a cavity formed in a die; press forming said raw material powder to form a plurality of green compacts, placing said green compacts on a sintering plate having a center; and sintering said green compacts simultaneously to form said sintered articles, wherein each of said green compacts is formed having at least one of a density gradient or a dimensional gradient, said at least one gradient decreasing in a predetermined direction across said green compact, and wherein each of said green compacts is substantially oriented on said sintering plate in plan view with said gradient decreasing outwardly from the center of said sintering plate.

	Abstract
	One object of the present invention is to provide a rare earth magnet alloy
	ingot, which has improved magnetic properties. In order to achieve the object,
	the present invention provides a rare earth magnet alloy ingot, wherein the rare
	earth magnet alloy ingot comprises an R-T-B type magnet alloy (R represents
	at least one element selected from among rare earth elements, including Y; and
	T represents a substance predominantly comprising Fe, with a portion of Fe atoms being optionally substituted by Co, Ni, Cu, Al, Ga, Cr, and Mn)
	containing at least one element selected from among Nd, Pr, and Dy in a total
	amount of 11.8 to 16.5% by atom and B in an amount of 5.6 to 9.1% by atom;
	and wherein as determined in an as-cast state of the alloy ingot, R-rich phase
	that measures 100 .mu.m or more is substantially absent on a cross section.
	What is claimed is:
	1. A production method [process/method] for a rare earth magnet alloy ingot,
	wherein the production method comprising receiving molten metal by means
	of a rotary body; sprinkling the molten metal by the effect of rotation of the
	rotary body; and causing the sprinkled molten metal to be deposited and solidify on an inner surface of a rotating cylindrical mold; and wherein the
	inner surface includes a non smooth surface is comprised of grooves having a
	depth of 0.5 to 1 mm.
	4. A production method for a rare earth magnet alloy ingot comprising
	receiving a molten alloy of rare earth metal alloy by means of a rotary body;
	sprinkling the molten alloy by the effect of rotation of the rotary body, and
	causing the sprinkled molten alloy to be deposited and solidify on an inner wall surface of a rotating cylindrical mold; wherein a film having a thermal
	conductivity lower than that of material comprising the mold is provided to the
	(Tokyo, JAPAN)

			inner wall surface of the cylindrical mold.

Filed: November	7,390,579	Assignee:	Coating formulation and application of organic passivation layer onto iron- based rare earth powders
23, 2004		Magnequench, Inc.	
Issued: June 24, 2008 Expires: Nov 2024		(Singapore, Republic of Singapore)	Abstract The present disclosure relates to coating formulations for neodymium-iron-boron type magnetic powders manufactured from rapid solidification processes for the purpose, inter alia, of corrosion and oxidation resistance when exposed to aggressive environments. The coating formulation preferably contains an epoxy binder, curing agent, an accelerating agent, and a lubricant. By incorporating coupling agents and optionally, other specialty additives with the magnetic powder and the organic epoxy components, additional oxidation and corrosion prevention, enhanced adhesion and dispersion between the filler and matrix phases can be achieved. This disclosure relates to all such rare earth-transition metal-boron (RE-TM-B) powders produced by rapid solidification and encompasses both the bonded magnet products that include combinations of the materials mentioned and the application processes.
			What is claimed is:  1. A rapidly solidified rare earth-transition metal-boron magnet material, comprising <i>[composition of matter]</i> a coated rare earth-transition metal-boron magnet powder comprising the magnet powder and a coating formulation, wherein the coating formulation comprises a combination, in an amount by weight of the magnet powder, of about 0.1 weight percent to about 1 weight percent of an organotitanate or organozirconate coupling agent, about

			0.18 weight percent to about 4.46 weight percent of an epoxy resin, about 0.01 weight percent to about 0.27 weight percent of an amine-based hardener, about 0.004 weight percent to about 0.09 weight percent of an accelerator, and about 0.003 weight percent to about 0.27 weight percent of a lubricant; wherein the general form of the coupling agent is (RO).sub.n(Ti or Zr)(OR'Y).sub.4-n where R is a neopentyl(diallyl), dioctyl, or (2,2-diallyloxymethyl)butyl group, Ti or Zr has a coordination number of 4, R' is a phosphito, pyrophosphato or cyclic pyrophosphato segment, and Y is a dioctyl or ditridecyl end group with 1.ltoreq.n.ltoreq.4.
			3. A rapidly solidified rare earth-transition metal-boron magnet material comprising <i>[composition of matter]</i> a coated rare earth-transition metal-boron magnet powder comprising the magnet powder and a coating formulation, wherein the coating formulation comprises a combination, in an amount by weight of the magnet powder, of about 0.225 weight percent to about 4.25 weight percent of epichlorohydrin/cresol novolac epoxy resin, about 0.01 weight percent to about 0.26 weight percent of dicyandiamide hardener, about 0.005 weight percent to about 0.085 weight percent of an aromatic, tertiary amine accelerator, about 0.004 weight percent to about 0.27 weight percent of zinc stearate lubricant, and about 0.35 weight percent to about 0.75 weight percent of an organotitanate coupling agent of the form (RO)Ti(OR'Y).sub.3 where R is a neopentyl(diallyl), Ti has a coordination number of 4, R' is a pyrophosphato segment, and Y is a dioctyl end group.

		Corporation \	Abstract
Issued:			The bonded magnet of the present invention, in which average particle
April 15,		(Tokai-shi, JAPAN)	diameter and compounding ratio are specified, is comprised of Cobalt-less R1
2008			d-HDDR coarse magnet powder that has been surface coated with surfactant,
			R2 fine magnet powder that has been surface coated with surfactant (R1 and
Expires:			R2 are rare-earth metals), and a resin which is a binder. The resin, a
Nov 2023			ferromagnetic buffer in which R2 fine magnet powder is uniformly dispersed,
			envelops the outside of the Cobalt-less R1 d-HDDR coarse magnet powder.
			Despite using Cobalt-less R1 d-HDDR anisotropic magnet powder, which is
			susceptible to fracturing and therefore vulnerable to oxidation, the bonded
			magnet of the present invention exhibits high magnetic properties along with
			extraordinary heat resistance.
			Contrary to the technology's conventional wisdom coarse Co-less NdFeB
			anisotropic magnet powder, which has poor resistance to oxidation, , combined
			with fine SmFeN anisotropic magnet powder, having similarly poor oxidation
			resistance, succeeded at obtaining a composite rare-earth anisotropic bonded
			magnet which has excellent initial magnetic properties, and exhibits ample heat
			resistance (irreversible loss properties) the same or greater than bonded
			magnets that use Co-containing anisotropic magnet powder.
			What is claimed is:
			What is claimed is.
			1. A composite rare-earth anisotropic bonded magnet, comprising
			[composition of matter]: (A) Cobalt-less R1 d-HDDR coarse powder with an
			average grain diameter of 40-200 .mu.m and having micro-cracks, comprising:
			1. Cobalt-less R1 d-HDDR anisotropic magnet powder, obtained by
			performing a d-HDDR treatment on a cobalt-less R1 alloy of a rare-earth
			element including yttrium (Y) (hereafter, "R1"), iron (Fe), and boron (B) as the

			main ingredients and fundamentally not containing cobalt; and 2. #1 surfactant that coats at least one part of the grain surface of said cobalt-less R1 d-HDDR anisotropic magnet powder; and (B) R2 fine magnet powder with an average aspect ratio of 2 or less and average grain diameter 1-10 .mu.m, comprising: 1. R2 anisotropic magnet powder with a maximum energy product (BH)max 240 kJ/m.sup.3 or more and with a rare-earth element including yttrium (hereafter, "R2") as one of the principle ingredients; and 2. #2 surfactant that coats at least one part of the grain surface of said R2 anisotropic magnet Powder and (C) a thermosetting resin as binder; wherein the said bonded magnet contains 50-84 wt % of said Co-less R1 d-HDDR coarse magnet powder, 15-40 wt % of said R2 fine magnet powder, and 1-10 wt % of said thermosetting resin; and wherein relative density (.rho./.rhosub.th) of the said bonded magnet, which is the ratio of volume density (.rho.) to theoretical density (.rhosub.th), is 91-99%; and wherein normalized grain count of the said Co-less R1 d-HDDR coarse magnet powder in the said bonded magnet, where per unit area apparent grain diameter is 20 .mu.m or less, is 1.2.times.10.sup.9 pieces/m.sup.2 or less; the said composite rare-earth anisotropic bonded magnet having the special characteristics of outstanding magnetic properties and heat tolerance.

		micialis.	invention, characterized in that it comprises providing an aqueous treating
			fluid, which contains a hydrolysis polymerization product of alkyl silicate and

			fine zinc particles having an average particle diameter of 1 .mu.m to 50 .mu.m and has a pH value of 6 to 8 and a viscosity of 1000 cP or less, applying the fluid on the surface of a rare earth metal-based permanent magnet, and subjecting the resultant magnet to a heat treatment at 250.degree. C. to 400.degree. C., to thereby form a corrosion-resistant film containing fine zinc particles dispersed therein.  The invention claimed is:
			1. A method for producing a corrosion-resistant rare earth metal-based permanent magnet <i>[process/method]</i> , characterized in that it comprises providing an aqueous treating fluid, which contains a hydrolysis polymerization product of alkyl silicate and zinc particles having an average particle diameter of 1 .mu.m to 50 .mu.m and has a pH value of 6 to 8 and a viscosity of 1000 cP or less, applying the fluid on the surface of a rare earth metal-based permanent magnet, and subjecting the resultant magnet to a heat treatment at 250.degree. C. to 400.degree. C., to thereby form a corrosion-resistant film containing zinc particles dispersed therein.
			10. The production method as claimed in claim 8, characterized in that the dip spin coating is carried out by supporting plural rare earth metal-based permanent magnets on approximately the outer peripheral edge portion of a turn table which is rotatable around a vertical center axis that is used as the axis of rotation, immersion coating the rare earth metal-based permanent magnets with the aqueous treating fluid by immersing the turn table having the rare earth metal-based permanent magnets supported thereon in an aqueous treating fluid tank, and after taking out the resulting turn table from the liquid, rotating the turn table to centrifugally cut off the aqueous treating fluid that has adhered in excess to the rare earth metal-based permanent magnets.
Filed:	7,328,500	Assignee:	Method of manufacturing laminated polar anisotropic hybrid magnet

April 28,		
2004	Jahwa Electronics Co.,	Abstract
2004	Ltd.	Disclosed is a method of manufacturing a laminated polar anisotropic hybrid
Issued:	Ltd.	magnet, which includes separately mixing first permanent magnet powders
February	(KOREA)	having low magnetic properties and second permanent magnet powders having
12, 2008	(KOKLA)	high magnetic properties with a thermoplastic resin to prepare first and second
12, 2006		compound pellets, respectively, and firstly injecting the first compound pellets
Expires:		by use of a first injection mold, to prepare a polar anisotropic and anisotropic
-		
April 2024		resin magnet, which is then placed into a second injection mold having an
		outer diameter lager than that of the first mold, followed by secondly injecting in a magnetic field together with the second compound pellets. The
		manufacturing method of the current invention is advantageous in terms of
		exhibition of higher magnetic properties of the laminated polar anisotropic
		hybrid magnet, and reduction of the use of expensive materials, thus generating
		economic benefits. Further, a flux density wave of the magnet can be easily
		controlled on the magnet surface to be suitable for performances and
		characteristics of the motors, and temperature properties of the magnet can be
		enhanced. Thereby, the entire manufacturing method can be efficiently carried
		out, therefore increasing productivity and reliability in practical use thereof.
		What is claimed is:
		1. A method of manufacturing a laminated polar anisotropic hybrid magnet
		[process/method], comprising: mixing at least one first permanent magnet
		powder having first magnetic properties with a thermoplastic resin to prepare
		first compound pellets having magnetic properties, and mixing at least one
		second permanent magnet powder having magnetic properties which are higher
		than said first magnetic properties with a thermoplastic resin to prepare second
		compound pellets having high magnetic properties which are higher than said
		magnetic properties of said first compound pellets; injection molding the first
		5 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

compound pellets by use of a first polar anisotropic and anisotropic mold

			having multi-poles and multi-cavities, to prepare a polar anisotropic and anisotropic resin magnet; and placing the polar anisotropic and anisotropic resin magnet into a second polar anisotropic mold having an outer diameter larger than that of said first polar anisotropic and anisotropic mold used for the firstly injection molding, thereby leaving a space between said polar anisotropic and anisotropic resin magnet and said second mold, injection molding in a magnetic field the second compound pellets into said space to manufacture a laminated polar anisotropic hybrid magnet with multi-poles and multi-layers.
			3. A method according to claim 1 wherein the at least one first permanent magnet powder comprises at least one powder selected from the group consisting of ferrite (Ba, Sr and Pb) powders and mixtures thereof, alnico powders, FeCrCo powders, SmCo powders, SmFeN powders, NdFeB powders, and mixtures thereof.

2004		TDK Corporation	Abstract A sintered body comprising a main phase consisting of an R.sub.2T.sub.14B
Issued: January 1, 2008  Expires: March 2024		(Tokyo, JAPAN)	phase (wherein R represents one or more rare earth elements (providing that the rare earth elements include Y), and T represents one or more transition metal elements essentially containing Fe, or Fe and Co), and a grain boundary phase containing a higher amount of R than the main phase, wherein a platy or acicular product exists. This sintered body enables to inhibit the grain growth, while keeping a decrease in magnetic properties to a minimum, and to improve a suitable sintering temperature range.
			What is claimed is:  1. An R-T-B system rare earth permanent magnet <i>[composition of matter]</i> , comprising a sintered body comprising: a main phase consisting of an R.sub.2T.sub.14B phase (wherein R represents one or more rare earth elements (providing that the rare earth elements include Y), and T represents one or more transition metal elements essentially containing Fe, or Fe and Co); and a grain boundary phase containing a higher total amount of R than said main phase, wherein a platy or acicular product exists, and wherein said sintered
El. 4	7211700	Accionate	body has a composition consisting essentially of 28% to 33% by weight of R, 0.5% to 1.5% by weight of B, 0.03% to 0.3% by weight of Al, 0.3 or less by weight (excluding 0) of Cu, 0.05% to 0.2% by weight of Zr, 4% or less by weight (excluding 0) of Co, and the balance substantially being Fe.

		A sintered body with a composition consisting of 25% to 35% by weight of R
Issued:	(Tokyo, JAPAN)	(wherein R represents one or more rare earth elements, provided that the rare
December		earth elements include Y), 0.5% to 4.5% by weight of B, 0.02% to 0.6% by
25, 2007		weight of Al and/or Cu, 0.03% to 0.25% by weight of Zr, 4% or less by weight
		(excluding 0) of Co, and the balance substantially being Fe. This sintered body
Expires:		has a coefficient of variation (CV value) showing the dispersion degree of Zr
Sept 2023		of 130 or less. In addition, this sintered body has a grain boundary phase
		comprising a region that is rich both in at least one element selected from a
		group consisting of Cu, Co and R, and in Zr. This sintered body enables to
		inhibit the grain growth, while keeping the decrease of magnetic properties to a
		minimum, and to improve the suitable sintering temperature range.
		What is claimed is:
		1. An R-T-B system rare earth permanent magnet, comprising a main phase
		[composition of matter] consisting of an R.sub.2T.sub.14B.sub.1 phase
		(wherein R represents one or more rare earth elements (provided that the rare
		earth elements include Y), and T represents at least one transition metal
		element containing, as a main constituent, Fe, or Fe and Co), and a grain
		boundary phase containing a higher total amount of R than said main phase, said R-T-B system rare earth permanent magnet being a sintered body having a
		composition consisting essentially of 28% to 33% by weight of R, 0.5% to
		1.5% by weight of B, 0.03% to 0.3% by weight of Al, 0.3% or less (excluding
		0) by weight of Cu, 0.05% to 0.2% by weight of Zr, 4% or less by weight
		(excluding 0) of Co 0.2% or less by weight of oxygen, and the balance
		substantially being Fe, said sintered body containing a region that is rich both
		Cu and Zr.
		2. An R-T-B system rare earth permanent magnet according to claim 1,
		wherein said rich region exists in said grain boundary phase.

## (Osaka, JAPAN)

Originally Sumitomo Special Metals Co., Ltd., now a 100% subsisidiary of Hitachi Metals. A blended powder including a first powder containing an R.sub.2T.sub.14B phase as a main phase, and a second powder containing an R.sub.2T.sub.17 phase at 25 wt % or more of the whole is prepared. Herein, R is at least one element selected from the group consisting of all rare-earth elements and Y (yttrium), T is at least one element selected from the group consisting of all transition elements, and Q is at least one element selected from the group consisting of B (boron) and C (carbon). The blended powder is sintered, so as to manufacture a permanent magnet having a structure in which a rare-earth element included in the second powder is concentrated in a grain surface region of a main phase.

## The invention claimed is:

1. A method of producing a sintered permanent magnet [process/method] comprising the steps of: preparing a blended powder including a first powder and a second powder, the first powder containing an R.sub.2T.sub.14Q phase (R is at least one element selected from the group consisting of all rare-earth elements and Y (yttrium) excluding Dy and Tb, T is at least one element selected from the group consisting of all transition elements, and Q is at least one element selected from the group consisting of B (boron) and C (carbon)) as a main phase, the second powder containing an R1.sub.2T.sub.17 phase (R1 is at least one element selected from the group consisting of Dy and Tb) at 25wt % or more of the second powder; compacting the blended powder; and sintering the compacted powder to concentrate Dy and/or Tb in a surface portion of the R.sub.2T.sub.14Q phase, wherein the first powder is a powder of alloy represented by a composition formula of R.sub.xT.sub.100-x-yQ.sub.y, and x and y for defining molar fractions satisfy the following relationships, respectively: 12.5.ltoreg.x.ltoreg.18(at %); and 5.5.ltoreg.y.ltoreg.20 (at %), and the second powder is a powder of alloy represented by a composition formula of R1.sub.pCu.sub.rT.sub.100-p-r, and p and r for defining molar fractions satisfy the following relationships respectively:

			10.ltoreq.p.ltoreq.20(at %); and 0.1.ltoreq.r.ltoreq.10(at %), and wherein the step of preparing the blended powder includes a step of performing a hydrogen embrittlement process to the alloy for the second powder, thereby obtaining an average particle diameter of the second powder of 100 .mu.m or less.

			The invention claimed is:
			1. A magnetizing method <i>[process/method]</i> for a rare earth magnet comprising: preparing a rare earth magnet having a cylindrical shape; a first magnetizing step of applying a first external magnetic field to the rare earth magnet, thereby forming a first region magnetized from an inner side to an outer side of the cylinder and a second region magnetized from the outer side to the inner side; and a second magnetizing step of applying a second external magnetic field in such a manner that an external magnetic field component in a direction for forming an angle of more than 0.degree. and less than 50.degree. with respect to an external magnetic field component applied in the first magnetizing step is applied to a boundary between the first region and the second region

## **U.S. Rare Earth Magnet Patents Table**

Disclaimer: This U.S. Rare Earth Magnet Patents Table contains a sample of the rare earth-magnet patents issued by the U.S. Patent and Trademark Office. It was created with key word searching. The Table is not all inclusive of U.S. magnet patents and does not include foreign patents. Some cells in the Table contain estimates, approximations or assessments. Please consult with a professional patent attorney or patent agent, possessing license to represent clients before the United States Patent and Trademark Office, before proceeding from informal patent database searches to formal patent actions.

Issued:		00., 2.0.	% of a rare-earth constituent which is Sm alone or at least 50 wt % Sm in
May 1, 2007		(Tokyo, JAPAN)	combination with at least one other rare-earth element, 10 45 wt % of Fe, 1 10 wt % of Cu and 0.5 5 wt % of Zr, with the balance being Co, and quenching the molten alloy in a strip casting process. The strip-cast alloy ingot has a
Expires: June 2024			content of 1 200 .mu.m size equiaxed crystal grains of at least 20 vol % and a thickness of 0.05 3 mm. Rare-earth sintered magnets made from such alloys exhibit excellent magnetic properties and can be manufactured under a broad optimal temperature range during sintering and solution treatment.
			The invention claimed is:
			1. A method of manufacturing a rare-earth sintered magnet, comprising [process/method] the steps of: melting an alloy consisting essentially of 20 to
			30 wt % of a rare-earth constituent R which is samarium alone or is at least 50 wt % samarium in combination with at least one other rare-earth element, 10 to

			45 wt % of iron, 1 to 10 wt % of copper and 0.5 to 5 wt % of zirconium, with the balance being cobalt; quenching the molten alloy in a strip casting process so as to form a rare-earth alloy ingot which has a content of 1 to 200 .mu.m size equiaxed crystal grains of at least 20 vol % and a thickness of 0.05 to 3 mm; heat-treating the ingot in a non-oxidizing atmosphere at 1000 to 1300.degree. C. for 0.5 to 20 hours to form a rare-earth magnet alloy; milling the rare-earth magnet alloy; compression-molding the milled alloy in a magnetic field to form a compact; sintering the compact; subjecting the sintered compact to solution treatment; and carrying out aging treatment on the solution-treated compact.
Filed:	7,208,856	Assignee:	Electric rotating machine
January 10, 2005		Mitsubishi	Abstract
2003		Wittsubisiii	Claw-shaped magnetic poles are alternately disposed along the rotation plane
Issued: April 24, 2007 Expires: Jan 2025		(Tokyo, JAPAN)	of a rotor of an electric rotating machine, and a permanent magnet is disposed between the claw-shaped magnetic poles. Surface of the permanent magnet is coated with a coating layer. The coating layer is composed of a anticorrosive material performing sacrificial anticorrosion (metal flake in a coating film rusts prior to a matrix resulting in protection of the matrix) such as inorganic material containing zinc and a film of the anticorrosive material is formed by spraying. Ionization tendency of zinc is larger than that of iron composing the permanent magnet, and the permanent magnet is difficult to be rusted owing to the sacrificial anticorrosion. Consequently, anticorrosion of the permanent magnet disposed between the claw-shaped magnetic poles is improved.
			What is claimed is:
			1. An electric rotating machine comprising <i>[composition of matter]</i> : a rotor provided with a rotor coil for generating magnetic flux; a pole core comprised of a first pole core and a second pole core respectively provided covering said

			rotor coil and each having claw-shaped magnetic poles protruding in an alternate engagement with each other; and a permanent magnet disposed on two sides of said claw-shaped magnetic poles, and reducing leakage of magnetic flux between sides of said claw-shaped magnetic poles adjacent to each other; and a stator disposed oppositely to said rotor via a space; wherein said permanent magnet is coated with an anticorrosive material performing a sacrificial anticorrosion function and having a varnish layer coated over said anticorrosive material.

Filed: January 31,	7,208,056	Assignee:	Rare earth sintered magnet, and method for improving mechanical strength and corrosion resistance thereof
2005		TDK Corporation	corrosion resistance thereof
2003		1DIX Corporation	Abstract
Issued:		(Tokyo, JAPAN)	An R-T-B system rare earth sintered magnet having a high mechanical strength
April 24,		, , ,	and excellent corrosion resistance is provided. The R-T-B system rare earth
2007			sintered magnet of the present invention comprises a sintered body comprising
F .			a main phase consisting of an R.sub.2T.sub.14B phase where R represents one
Expires: Jan 2025			or more rare earth elements and T represents one or more transition metal elements essentially containing Fe, or Fe and Co, and a grain boundary phase
Jan 2023			containing a higher amount of R than the above described main phase, wherein
			the surface of the above described sintered body is partially covered with a
			carbon compound layer. In the R-T-B system rare earth sintered magnet of the
			present invention, the area ratio of the partial surface of the above described
			sintered body covered with the above described carbon compound layer to the entire surface thereof is preferably between 10% and 90%.

			What is claimed is:
			1. A rare earth sintered magnet comprising <i>[composition of matter]</i> a sintered body, in which said sintered body comprises: a main phase consisting of an R.sub.2T.sub.14B phase where R represents one or more rare earth elements and T represents one or more transition metal elements essentially containing Fe, or Fe and Co; and a grain boundary phase containing a higher amount of R than said main phase, wherein the surface of said sintered body is partially covered with a carbon compound layer comprising RC.sub.0.4 and the area ratio of the partial surface of said sintered body covered with said carbon compound layer to the entire surface thereof is between 10% and 90%.
			8. A method <i>[process/method]</i> for improving the mechanical strength and corrosion resistance of a rare earth sintered magnet, in which the rare earth sintered magnet comprises a sintered body comprising: a main phase consisting of an R.sub.2T.sub.14B phase where R represents one or more rare earth elements and T represents one or more transition metal elements essentially containing Fe, or Fe and Co; and a grain boundary phase containing a higher amount of R than said main phase, wherein said method comprises: preparing a compacted body by compacting allay powders with a predetermined composition in a magnetic field; and sintering said compacted body into a sintered body in a state where a carbon-containing compound is placed in a sintering atmosphere for sintering the compacted body.

			The invention claimed is:
			1. A rare earth permanent magnet material comprising <i>[composition of matter]</i> 28 to 35% by weight of at least one rare earth element selected from the group consisting of neodymium, praseodymium, dysprosium, terbium, and holmium, 0.9 to 1.3% by weight of boron, 0.25 to 3% by weight of phosphorus, and iron, having a residual magnetic flux density of 11 to 18 kG, a magnetic coercive force of 14 to 21 kOe at 25.degree. C., and produced by sintering at a temperature in a range from 1,0000.degree. C. to 1,4000.degree. C.
			9. A rare earth permanent magnet material consisting <i>[composition of matter]</i> essentially of 28 to 35% by weight of at least one rare earth element selected from the group consisting of neodymium, praseodymium, dysprosium, terbium, and holmium, 0.9 to 1.3% by weight of boron, 0.25 to 3% by weight of phosphorus, 58 to 80% by weight of iron, 0.1 to 3.6% by weight of cobalt, and 0.02 to 0.25% by weight of copper, and having a residual magnetic flux density of 11 to 18 kG, a magnetic coercive force of 14 to 21 kOe at 25.degree.C.
Filed: June 24,	7,172,659	Assignee:	Method for producing quenched R-T-BC alloy magnet
2002		Neomax Co., Ltd.	Abstract
Issued: February 6, 2007		(Osaka, JAPAN)	The present invention is a production method of an R-T-BC rare earth alloy (R is at least one element selected from the group consisting of rare earth elements and yttrium, T is a transition metal including iron as a main component, B is boron, and C is carbon). An R-T-B bonded magnet containing

Expires: June 2022		Originally Sumitomo Special Metals Co., Ltd., now a 100% subsisidiary of Hitachi Metals.	a resin component, or an R-T-B sintered magnet with a resin film formed on the surface thereof is prepared, and a solvent alloy containing a rare earth element R and a transition metal element T is prepared. Thereafter, the R-T-B bonded magnet is molten together with the solvent alloy. In this way, a rare earth alloy can be recovered from a spent bonded magnet or a defective one generated in a production process stage, and a rapidly quenched alloy magnet can be obtained. As a result, magnet powder is recovered from the R-T-B magnet, and the recycling of a magnet including a resin component can be realized.
			The invention claimed is:
			1. A production method <i>[process/method]</i> of an R-T-BC rare earth alloy (R is at least one element selected from the group consisting of rare earth elements and yttrium, T is a transition metal including iron as a main component, B is boron, and C is carbon) comprising the steps of: preparing an R-T-B magnet containing a resin component; preparing a solvent alloy containing a rare earth element R and a transition metal element T, ratio of said transition metal clement T being between 50 percent and 95 percent by weight, inclusive; and melting the R-T-B magnet together with the solvent alloy; wherein said R-T-B magnet and said solvent alloy are mixed at a ratio of 5:95 to 80:20, inclusive, by weight.

Rare earth magnet and method for manufacturing the same
June 22, 2004		Neomax Co., Ltd.	Abstract
Issued: November 28, 2006 Expires: June 2024		(JAPAN)  Originally Sumitomo Special Metals Co., Ltd., now a 100% subsisidiary of Hitachi Metals.	Rare earth alloy powder having an oxygen content of 50 to 4000 wt. ppm and a nitrogen content of 150 to 1500 wt. ppm is compacted by dry pressing to produce a compact. The compact is impregnated with an oil agent and then sintered. The sintering process includes a first step of retaining the compact at a temperature of 700.degree. C. to less than 1000.degree. C. for a period of time of 10 to 420 minutes and a second step of permitting proceeding of sintering at a temperature of 1000.degree. C. to 1200.degree. C. The average crystal grain size of the rare earth magnet after the sintering is controlled to be 3 .mu.m to 9 .mu.m.  What is claimed is:

			1. A method for manufacturing <i>[process/method]</i> an RFeB rare earth magnet, comprising the steps of: preparing a rare earth alloy powder having an oxygen content in a range of 50 wt. ppm to 4000 wt. ppm and a nitrogen content in a range of 150 wt. ppm to 1500 wt. ppm and embrittling an RFeB rare earth alloy by hydrogen occlusion and milling the embrittled alloy; compacting the rare earth alloy powder by dry pressing to produce a compact; and, sintering the compact, wherein the step of sintering the compact includes: a first step of retaining the compact at a temperature in a range of 700.degree. C. to less than 1000.degree. C. for a period of time in a range of 10 minutes to 420 minutes and releasing hydrogen outside the compact so that the amount of hydrogen contained in sintered magnet is in a range of 10 wt. ppm to 100 wt. ppm; and a second step of permitting the proceeding of sintering at a temperature in a range of 1000.degree. C. to 1200.degree. C., and the average crystal grain size of the rare earth magnet after the sintering is in a range of 3 .mu.m to 9 .mu.m.
Filed: May 27,	7,138,070	Assignee:	Magnetic material manufacturing method, ribbon-shaped magnetic materials, powdered magnetic material and bonded magnets
2003		Seiko Epson	
		Corporation	Abstract
Issued:		1	A magnetic material manufacturing method, a ribbon-shaped magnetic
November		(JAPAN)	material manufactured by the method, a powdered magnetic material formed
21, 2006			from the ribbon-shaped magnetic material and a bonded magnet manufactured using the powdered magnet material are disclosed. The method and the
Expires:			magnetic materials can provide magnets having excellent magnetic properties
May 2023			and reliability. A melt spinning apparatus 1 is provided with a tube 2 having a nozzle 3 at the bottom thereof, a coil 4 for heating the tube and a cooling roll 5
			having a circumferential surface 53 on which dimple correcting means is
			provided. A melt spun ribbon 8 is formed by injecting the molten alloy 6 from
			the nozzle 3 so as to be collided with the circumferential surface 53 of the
			cooling roll 5 in an inert gas atmosphere (ambient gas) such as helium gas, so
			that the molten alloy 6 is cooled and then solidified. In this process, dimples to

be produced on a roll contact surface of the melt spun ribbon are divided by the dimple correcting means, thereby preventing formation of huge dimples.

What is claimed is:

1. A ribbon-shaped magnetic material which is manufactured [process/method] colliding a molten alloy to a circumferential surface of a cooling roll so as to cool and then solidify it, the ribbon-shaped magnetic material having an alloy composition represented by the formula of R.sub.x(Fe.sub.1-yCo.sub.y).sub.100-x-y-zB.sub.z(where R is at least one rare-earth element, x is 10 15 at %, y is 0 0.30 and z is 4 10 at %), wherein the circumferential surface of the cooling roll has dimple correcting means for dividing dimples to be produced on a roll contact surface of the ribbon-shaped magnetic material which is in contact with the circumferential surface of the cooling roll, the dimple correcting means comprising a plurality of grooves or ridges formed in the circumferential surface of the cooling roll in which the average pitch of the grooves or ridges is in the range of 7.5 to 40.0 .mu.m, and the average height of the ridges or the average depth of the grooves is in the range of 0.5 to 20 .mu.m; the roll contact surface of the ribbon-shaped magnetic material is formed with ridges or grooves which correspond to the grooves or ridges of the dimple correcting means and which are formed by transfer of the ridges or grooves of the circumferential surface of the cooling roll to the roll contact surface of the ribbon-shaped magnetic material; and the dimples produced on the roll contact surface of the ribbon-shaped magnetic material upon solidification thereof include dimples each having an area equal to or greater than 2000 .mu.m.sup.2, a ratio of the area of the roll contact surface occupied by the thus produced dimples with respect to the total area of the roll contact surface of the ribbon-shaped magnetic material being equal to or less than 10% due to the ridges or grooves formed by the transfer.

3. A powdered magnetic material which is obtained by [process/method]

			milling the ribbon-shaped magnetic material of claim 1.

(Osaka, JAPAN) Originally Sumitomo Special Metals Co., Ltd., now a 100% subsisidiary of Hitachi Metals.	Abstract The present invention provides a rare-earth sintered magnet exhibiting desirable magnetic properties in which the amount of Nd and/or Pr forming a non-magnetic phase in a grain boundary phase is reduced. Specifically, the present invention provides a rare-earth sintered magnet having a composition of (R1.sub.x+R2.sub.y)T.sub.100-x-y-zQ.sub.z where R1 is at least one element selected from the group consisting of all rare-earth elements excluding La (lanthanum), Y (yttrium) and Sc (scandium); R2 is at least one element selected from the group consisting of La, Y and Sc; T is at least one element selected from the group consisting of all transition elements; Q is at least one element selected from the group consisting of B and C, and including, as a main phase, a crystal grain of an Nd.sub.2Fe.sub.14B crystalline structure, wherein: molar fractions x, y and z satisfy 8.ltoreq.x.ltoreq.18 at %, 0.1.ltoreq.y.ltoreq.3.5 at % and 3.ltoreq.z.ltoreq.20 at %, respectively; and a concentration of R2 is higher in at least a part of a grain boundary phase than in the main phase crystal grains.

		What is claimed is:  1. A rare-earth sintered magnet of a composition [composition of matter] of (R1.sub.x+R2.sub.y)T.sub.100-x-y-zQ.sub.z, where R1 is at least one element selected from the group consisting of all rare-earth elements excluding La, Y and Sc, R2 is Y and may optionally include La and/or Sc, T is at least one
		element selected from the group consisting of all transition elements, and Q is B and may optionally include C, and comprising a crystal grain of an Nd.sub.2Fe.sub.14B type compound as a main phase, wherein: molar fractions x, y and z satisfy 8.ltoreq.x.ltoreq.18 at %, 0.1.ltoreq.y.ltoreq.3.5 at % and 3.ltoreq.z.ltoreq.20 at %, respectively; and a concentration of R2 is higher in at least a part of a grain boundary phase than in the crystal grain, and wherein an amount of oxygen is in a range of 2000 ppm to 8000 ppm by weight.
		3. A method of producing a rare-earth sintered magnet, [process/method] comprising the steps of: preparing a powder of a rare-earth alloy having a composition of (R1.sub.x+R2.sub.y)T.sub.100-x-y-zQ.sub.z where R1 is at least one element selected from the group consisting of all rare-earth elements excluding La, Y and Sc; R2 is Y and may optionally include La and/or Sc; T is at least one element selected from the group consisting of all transition elements; and Q is B and may optionally include C, wherein molar fractions x, y and z satisfy 8.ltoreq.x.ltoreq.18 at %, 0.1.ltoreq.y.ltoreq.3.5 at % and 3.ltoreq.z.ltoreq.20 at %, respectively, and wherein an amount of oxygen
Filed: 7,02	22,252 Assig	included in the rare-earth alloy powder is in a range of 2000 ppm by weight to 8000 ppm by weight; and sintering the rare-earth alloy powder, wherein R2 existing in a main phase crystal grain of an Nd.sub.2Fe.sub.14B crystalline structure in the rare-earth alloy before sintering is diffused into a grain boundary phase in the sintering step, whereby a concentration of R2 is higher in at least a part of the grain boundary phase than in the crystal grain.  Permanent magnetic alloy and bonded magnet

Expires: June 2022		Ltd., now a 100% subsisidiary of Hitachi Metals.	rare earth alloy block therein. A hydrogen gas and an inert gas are introduced into the inner space through the gas inlet port, and are exhausted from the inner space through the gas outlet port. The gaseous flow is produced by a fan, for example, in the inner space. The windbreak plate is disposed upstream with respect to the gaseous flow that has been produced inside the inner space. Also, the windbreak plate reduces a flow rate of the gaseous flow that has been produced near the upper opening of the container.  The invention claimed is:  1. An apparatus for subjecting a rare earth alloy block to a hydrogenation process, the apparatus comprising: a casing that defines an inner space for receiving a container, the container including an upper opening and arranged to store the rare earth alloy block therein; a gas inlet port for introducing a hydrogen gas and an inert gas into the inner space of the casing; a gas outlet
			port for exhausting the gases from the inner space of the casing; a member arranged to produce a gaseous flow inside the inner space; and a windbreak plate, which is disposed upstream with respect to the gaseous flow that has been produced inside the inner space and which reduces a flow rate of the gaseous flow that has been produced near the upper opening of the container.
			8. A method <i>[process/method]</i> for producing a rare earth sintered magnet, the method comprising the steps of: (a) preparing a container, which includes an upper opening and which stores a rare earth alloy block therein; (b) pulverizing the rare earth alloy block into a coarse powder by performing a hydrogen pulverization process using the apparatus as recited in claim 1; (c) making a fine powder from the coarse powder; and (d) compacting the fine powder to obtain a green compact and sintering the green compact.

March 21,			Abstract
2006			One object of the present invention is to provide a rare earth magnet alloy
Expires:			ingot, which has improved magnetic properties. In order to achieve the object, the present invention provides a rare earth magnet alloy ingot, wherein the rare
Sept 2022			earth magnet alloy ingot comprises an R-T-B type magnet alloy (R represents
Sept 2022			at least one element selected from among rare earth elements, including Y; and
			T represents a substance predominantly comprising Fe, with a portion of Fe
			atoms being optionally substituted by Co, Ni, Cu, Al, Ga, Cr, and Mn.)
			containing at least one element selected from among Nd, Pr, and Dy in a total amount of 11.8 to 16.5% by atom and B in an amount of 5.6 to 9.1% by atom;
			and wherein as determined in an as-cast state of the alloy ingot, R-rich phase
			that measures 100 .mu.m or more is substantially absent on a cross section.

## What is claimed is:

- 1. A rare earth magnet alloy ingot, wherein the rare earth magnet alloy ingot comprises *[composition of matter]* an R-T-B magnet alloy (R represents at least one element selected from among rare earth elements, including Y; and T represents a substance predominantly comprising Fe, with a portion of Fe atoms being optionally substituted by Co, Ni, Cu, Al, Ga, Cr, and Mn) containing at least one element selected from among Nd, Pr, and Dy in a total amount of 11.8 to 16.5% by atom and B in an amount of 5.6 to 9.1% by atom; and wherein as determined in an as-cast state of the alloy ingot, the as-cast state contains an R-rich phase that has a maximum width of 50 .mu.m, and the area occupied by the R-rich phase accounts for at least 50% of the cross section of the as-cast state.
- 2. A rare earth magnet alloy ingot according to claim 1, wherein the rare earth magnet alloy ingot contains crystal grains *[composition of matter]* having a diameter of at least 1,000 .mu.m as measured along the major axis occupy an area percentage of at least 5%, and has an average R-rich phase spacing of 10 .mu.m or less.
- 4. A rare earth magnet alloy ingot according to claim 1, wherein the rare earth magnet alloy ingot is cast *[process/method]* through centrifugal casting comprising receiving molten metal by means of a rotary body; sprinkling the molten metal by the effect of rotation of the rotary body; and causing the sprinkled molten metal to be deposited and solidify on an inner surface of a rotating cylindrical mold; and wherein the inner surface including a non-smooth surface.
- 7. A rare earth magnetic alloy ingot according to claim 1, wherein a portion of Fe atoms is optionally substituted with at least one of Co, Ni, Cu and Al.

A ferrite magnet obtained by adding a ferrite having a spinel-type structure to a ferrite having a hexagonal M-type magnetoplumbite structure, in which a portion of Sr, Ba, Pb or Ca is replaced with at least one element that is selected from the group consisting of the rare-earth elements (including Y) and Bi and that always includes La, during the fine pulverization process thereof. By adding a small amount of the element such as Co, Ni, Mn or Zn to the ferrite already having the hexagonal M-type magnetoplumbite structure during the fine pulverization process thereof, the magnetic properties can be improved.

## What is claimed is:

1. A method of making *[process/method]* a ferrite calcined body, the method comprising the steps of: preparing a material powder mixture by mixing: a material powder of at least one compound that is selected from the group consisting of SrCO<sub>3</sub>, BaCO<sub>3</sub>, PbO and CaCO<sub>3</sub>; an oxide material powder of at least one element to be selected from the group consisting of the rare-earth elements (including Y) and Bi, the oxide material powder always including La<sub>2</sub>O<sub>3</sub>; and a material powder of Fe<sub>2</sub>O<sub>3</sub>; calcining the material powder mixture at a temperature of 1,100° C. to 1,450° C., thereby forming a ferrite calcined body having an M-type magnetoplumbite structure and a composition represented by the general formula:  $(1-x)AO.(x/2)R_2O_3$ . n Fe<sub>2</sub>O<sub>3</sub> where A is at least one element selected from the group consisting of Sr, Ba, Pb and Ca; R is at least one element selected from the group consisting of the rare-earth elements (including Y) and Bi and always includes La;  $0.05 \le x < 0.3$ ; and 5.0≦n≦6.5; preparing another material powder mixture by mixing an oxide material powder of at least one element selected from the group consisting of Co, Ni, Mn and Zn and a material powder of Fe<sub>2</sub>O<sub>3</sub>; calcining the material powder mixture at a temperature of 700° C. to 1,450° C., thereby forming a ferrite calcined body having a spinel-type structure and a composition represented by the general formula: MO.Fe<sub>2</sub>O<sub>3</sub> where M is at least one element selected from the group consisting of Co, Ni, Mn and Zn; and preparing a calcined body by adding the ferrite calcined body

			having the spinel-type structure at 0.2 wt % to 6.2 wt % to the ferrite calcined body having the M-type magnetoplumbite structure.
Filed:	6,955,729	Assignee:	Alloy for bonded magnets, isotropic magnet powder and anisotropic magnet powder and their production method, and bonded magnet

2003		Corporation	Abstract
Issued:			An alloy for bonded magnets of the present invention includes at least a main
October		(Tokai, JAPAN)	component of iron (Fe), 12-16 atomic % (at %) of rare-earth elements (R)
18, 2005			including yttrium (Y), and 10.8-15 at % of boron (B), and is subjected to a hydrogen treatment method as HDDR process or d-HDDR process. Using the
Expires:			magnet powder obtained from carrying out d-HDDR processing, etc. on this
Jan 2023			magnet alloy, pellets with superior insertion characteristics into bonded magnet
			molding dies can be obtained, and bonded magnets with superior magnetic
			properties and showing low cost can be obtained.
			What is claimed is:
			1. An alloy comprising <i>[composition of matter]</i> a main component of iron (Fe); 12-16 atomic % of R, where R is at least one selected from the group consisting of rare-earth elements and yttrium (Y), and 0.01-1.0 atomic % of lanthanum (La) is included in the 12-16 atomic % of R; and 10.8-15 atomic % of boron (B).
			3. The alloy according to claim 1, further comprising 0.1-6 atomic % of cobalt (Co).
			4. The alloy according to claim 1, further comprising at least one of gallium (Ga), zirconium (Zr), vanadium (V), aluminum (Al), titanium (Ti), hafnium (Hf) and copper (Cu) in a total amount of 0.1-2 atomic %; and at least one of niobium (Nb), tantalum (Ta) and nickel (Ni) in a total amount of 0.1-2 atomic

			%.
			70.
			5. The alloy according to claim 1, wherein 0.01-0.7 atomic % of La is included in the 12-16 atomic % of R.
			6. An isotropic magnet powder made by a HDDR process comprising <i>[process/method]</i> a hydrogenation step where an alloy comprising a main composition of Fe; 12-16 atomic % of R, where R is at least one selected from the group consisting of rare-earth elements and yttrium (Y), and 0.01-1.0 atomic % of lanthanum (La) is included in the 12-16 atomic % of R; and 10.8-15 atomic % of B is maintained in a hydrogen gas atmosphere at 1023-1173 K, and after said hydrogenation step, a desorption step where hydrogen is removed from the alloy.

			flakes exhibits simultaneous increase of both a remanence as a function of
			magnetizing field and coercivity; and hence, exhibits a well-balanced
			demagnetization curve even in an unsaturated magnetized state.
			What is claimed is:
			1. A permanent magnet field small DC motor comprising <i>[composition of</i>
			<i>matter]</i> : a soft-magnetic frame; and an arc-shaped permanent magnet fixed in

			said soft-magnetic frame, wherein an outer surface of said arc-shaped permanent magnet has a pair of end portions and a middle portion therebetween in a thrust direction, said end portions fit along an inner surface of said soft-magnetic frame, and said middle portion has a pair of recessed sections that are recessed on outer middle portion regions of said middle portion with respect to said end portions.
Filed: November	6,994,755	Assignee:	Method of improving toughness of sintered RE-Fe-B-type, rare earth permanent magnets
13, 2002		University of Dayton	
Issued: February 7,		(Dayton, OH, USA)	Abstract Disclosed are methods for producing compositionally modified sintered RE FeB-based rare earth permanent magnets, by the addition of small amounts of
2006		Electron Energy	Nd, Cu, Ti, Nb, or other transition metals, and mixtures thereof, to maximize fracture toughness with corresponding improved machinability, while
Expires: Nov 2022		Corporation (Landisville, PA,USA)	maintaining maximum energy product, said method comprising the steps of: (a) prepare a magnetic composition; (b) melt the composition and form powders with an average particle size smaller than 5 microns from the same; (c) press the powder under a magnetic field to obtain green compacts, which are then sintered at from about 1030.degree. C. to 1130.degree. C., and heat treating the sintered material at from about 570.degree. C. to 900.degree. C. What is claimed is:
			1. A method of improving <i>[process/method]</i> the room temperature fracture toughness of sintered REFeB permanent magnets comprising: a) providing an REFeB magnet composition where RE is Nd; b) modifying said magnet composition by increasing the amount of Nd to provide from 18 to 22% by weight Nd and c) sintering said magnet; wherein said magnet has a room temperature fracture toughness of 13.3 ft-lbs/in.sup.2 to 22.1 ft-lbs/in.sup.2.
			2. A method of imparting improved fracture toughness <i>[process/method]</i> to a class of sintered rare earth permanent magnets comprising modifying the

			composition of an REFeB permanent magnet to produce the formula: (a) Nd.sub.wFe.sub.94-wB.sub.6 wherein: w has a value between 18 and 22; wherein said rare earth permanent magnet has a maximum energy product of at least about 30 MGOe and a room temperature fracture toughness of 13.3 ft-lbs/in.sup.2 to 22.1 ft-lbs/in.sup.2.
Filed: November 13, 2002  Issued: November 22, 2005  Expires: Nov 2022	6,966,953	Assignee: University of Dayton (Dayton, OH, USA) Electron Energy Corporation (Landisville, PA,USA)	Modified sintered RE-Fe-B-type, rare earth permanent magnets with improved toughness  Abstract Compositionally modified, sintered RE-FeB-based rare earth permanent magnets demonstrate the optimum combination of mechanical and magnetic properties, thereby maximizing fracture toughness with corresponding improved machinability, while maintaining the maximum energy product (BH).sub.max.  What is claimed is:  1. A class of sintered rare earth permanent magnets [composition of matter] having improved fracture toughness, said magnets having the general formula: (a) Nd.sub.w Fe.sub.94-w B.sub.6, wherein: w has a value between 18 and 22; said class of magnets having a maximum energy product of at least about 30 MGOe and a room temperature fracture toughness from 13.3 ft-lbs/in.sup.2 to 22.1 ft-lbs/in.sup.2.
			[composition of matter] represented by Nd.sub.w Fe.sub.94-w B.sub.6 are selected from the group consisting of: Nd.sub.18 Fe.sub.76 B.sub.6, Nd.sub.19 Fe.sub.75 B.sub.6, Nd.sub.20 Fe.sub.74 B.sub.6, Nd.sub.21 Fe.sub.73 B.sub.6, and Nd.sub.22 Fe.sub.72 B.sub.6.

Filed:	6,979,409	Assignee:	Highly quenchable Fe-based rare earth materials for ferrite replacement
February 6,		Magnequench, Inc.	
2003		(Singapore, SG)	Abstract
Issued: December 27, 2005  Expires: February 2023			The present invention relates to highly quenchable Fe-based rare earth magnetic materials that are made by rapid solidification process and exhibit good magnetic properties and thermal stability. More specifically, the invention relates to isotropic NdFeB type magnetic materials made from a rapid solidification process with a lower optimal wheel speed and a broader optimal wheel speed window than those used in producing conventional magnetic materials. The materials exhibit remanence (B.sub.r) and intrinsic coercivity (H.sub.ci) values of between 7.0 to 8.5 kG and 6.5 to 9.9 kOe, respectively, at room temperature. The invention also relates to process of making the materials and to bonded magnets made from the magnetic materials, which are suitable for direct replacement of anisotropic sintered
			ferrites in many applications.
			CLAIMS  1. A magnetic material having been prepared by a rapid solidification process, followed by a thermal annealing process, said magnetic material having the composition, in atomic percentage, of
			(R1-aR'a)uFe100-u-v-w-x-yCovMwTxBy
			wherein R is Nd, Pr, Didymium (a nature mixture of Nd and Pr at composition of Nd0.75Pr0.25), or a combination thereof; R' is La, Ce, Y, or a combination thereof; M is one or more of Zr, Nb, Ti, Cr, V, Mo, W, and Hf; and T is one or more of Al, Mn, Cu, and Si, wherein $0.01 \le a \le 0.8$ , $7 \le u \le 13$ , $0 \le v \le 20$ , $0.01 \le w \le 1$ , $0.1 \le x \le 5$ , and $4 \le y \le 12$ , and wherein the magnetic material exhibits a remanence (Br) value of from about 6.5 kG to about 8.5 kG and an intrinsic coercivity (Hci) value of from about 6.0 kOe to about 9.9 kOe.

			[x10.sup9 J.multidot.m.sup.3/g.sup.2] .gtoreq. 2.10, and the intrinsic
			coercive force H.sub.CJ of the bonded magnet at the room temperature is in the
			range of 400-760 kA/m.
			14.1.go 01 100 7 00 111 2 1111
			What is claimed is:
			1. An isotropic bonded magnet formed by <i>[composition of matter]</i> binding a
			magnetic powder containing Al with a binding resin, wherein the isotropic
			bonded magnet is characterized in that: the magnetic powder is composed of
			an alloy composition resented by R.sub.x (Fe.sub.1-x Co.sub.y).sub.100-x-z-w
			B.sub.z Al.sub.w (where R is at least one rare-earth element, x is 7.1-9.9 at %,
			v is 0-0.30, z is 4.6-6.9 at %, and w is 0.02-1.5 at %), when the density of the
			isotropic bonded magnet is defined as .rho.[Mg/m.sup.3], the remanent
			magnetic flux density Br[T] at room temperature satisfies the relationship

			represented by the formula of Br/.rho.[.times.10.sup6 T.multidot.m.sup.3 /g]>0.125; the irreversible susceptibility (.chisub.irr) of the isotropic bonded magnet which is measured by using an intersectioning point of a demagnetization curve in the J-H diagram representing point of a demagnetization curve in the J-H diagram representing the magnetic properties at the room temperature and a straight line which passes the origin in the J-H diagram and has a gradient (J/H) of -3.8.times.10.sup6 H/m as a starting point is less than 5.0.times.10.sup7 H/m; and the intrinsic coercive force (H.sub.CJ) of the isotropic bonded magnet at the room temperature is in the range of 320-720 kA/m.
Filed: March 7, 2003  Issued: September 13, 2005  Expires: March 2023	6,942,930	Assignee: Seiko Epson Corporation (JAPAN	Cooling roll, ribbon-shaped magnetic materials, magnetic powders and bonded magnets  Abstract Disclosed herein is a cooling roll which can provide bonded a magnet having excellent magnetic properties and having excellent reliability. A melt spinning apparatus 1 is provided with a tube 2 having a nozzle 3 at the bottom thereof, a coil 4 for heating the tube and a cooling roll 5 having a circumferential surface 53 in which gas expelling grooves 54 are formed. A melt spun ribbon 8 is formed by injecting the molten alloy 6 from the nozzle 6 so as to be collided with the circumferential surface 53 of the cooling roll 5, so that the molten alloy 6 is cooled and then solidified. In this process, gas is likely to enter between a puddle 7 of the molten alloy 6 and the circumferential surface 53, but such gas is expelled by means of the gas expelling grooves 54.
			What is claimed is:  1. A ribbon-shaped magnetic material <i>[composition of matter]</i> , which is manufactured by colliding a molten alloy to a circumferential surface of a cooling roll so as to cool and then solidify the molten alloy, comprising: a roll

			contact surface; and a free surface, the free surface being opposite the roll contact surface; wherein the roll contact surface is devoid of dimples; and the cooling roll has gas expelling means defined by at least one spiral-shaped groove with an average width of 0.5-90 .mu.m provided in the circumferential surface of the cooling roll, the gas expelling means for expelling gas entered between the circumferential surface and a puddle of the molten alloy, and preventing the molten alloy from entering the spiral-shaped groove.  2. A magnetic powder which is obtained by milling the ribbon-shaped magnetic material described in claim 1.

	Metals.

member for accommodation and/or hold of work pieces, respectively, and, in depositing a metal depositing material on each of the surface of the work pieces with the accommodating member and/or the holding member being made rotated about the horizontal rotational axis thereof, carrying out vapor deposition with a Vickers hardness of a film formed on each of the surface of the work pieces maintained at 25 or more. According to the present invention, production of projections in a metal deposited-film can be effectively inhibited when forming the metal deposited-film of aluminum, zinc or the like on the surface of a work piece such as a rare earth metal-based permanent magnet.

## What is claimed is:

1. A method [process/method] of inhibiting production of projections in a metal deposited-film characterized by using a vapor deposition apparatus comprising, in a vacuum-treating chamber, an evaporating section for a depositing material, and an accommodating member and/or a holding member for accommodation and/or hold of work pieces, respectively, and, in depositing a metal depositing material on each of the surface of said work pieces with said accommodating member and/or said holding member being made rotated about the horizontal rotational axis thereof, carrying out vapor deposition with a Vickers hardness of a film formed on each of the surface of said work pieces maintained at 25 or more. said accommodating member and/or a holding member for accommodation and/or hold of work pieces is a tubular barrel for accommodation of said work pieces, said tubular barrel is formed of a mesh net having an open area ratio of 50 to 85%, said tubular barrel is revolvably supported circumferentially outside a horizontal rotational axis of a support member made rotatable about the rotational axis, for revolution about the rotational axis of said support member by rotating said support member, said tubular barrel revolves about the rotational axis of said support member, whereby vapor deposition is carried out under a condition that said work pieces collide with and rub against one another in said tubular barrel, a plurality of

			said tubular barrels are supported in an annular shape circumferentially outside the rotational axis of said support member, and said work piece is a rare earth metal-based permanent magnet.
Filed: January 16,	6,858,156	Assignee:	Ferrite magnet and both rotor and magnet roll comprising the same
2003		Hitachi Metals, Ltd.	Abstract
Issued: February 22, 2005 Expires: Jan 2023		(Tokyo, JAPAN)	A ferrite magnet having a basic composition represented by the following general formula: (A.sub.1-x R.sub.x)O.n[(Fe.sub.1-y M.sub.y).sub.2 O.sub.3] by atomic ratio, wherein A is Sr and/or Ba, R is at least one of rare earth elements including Y, M is at least one element selected from the group consisting of Co, Mn, Ni and Zn, and x, y and n are numbers meeting the conditions of 0.01.ltoreq.x.ltoreq.0.4, [x/(2.6n)].ltoreq.y.ltoreq.[x/(1.6n)], and 5.ltoreq.n.ltoreq.6, and substantially having a magnetoplumbite crystal structure, is obtained by uniformly mixing a compound of Sr and/or Ba with an iron compound; calcining the resultant uniform mixture; adding a compound of the R element and/or the M element to the resultant mixture. The compound of the R element and/or the M element may be added at a percentage of more than 0 atomic % and 80 atomic % or less, on an element basis, at a mixing step before calcination.  What is claimed is:  1. A ferrite magnet having a basic composition [composition of matter] represented by the following general formula:  wherein A is Sr and/or Ba, R is at least one rare earth element including Y, M is at least one element selected from the group consisting of Co, Mn, Ni and Zn, and x, y and n are numbers meeting the following conditions:

			0.01.ltoreq.x.ltoreq.0.4, 0.005.ltoreq.y.ltoreq.0.04, and 5.ltoreq.n.ltoreq.6,
			said ferrite magnet having a magnetoplumbite crystal structure, wherein the concentration of said R element and/or said M element is higher in crystal grain boundaries than in magnetoplumbite crystal grains.
Filed: September	6,856,231	Assignee:	Magnetically biasing bond magnet for improving DC superposition characteristics of magnetic coil
10, 2001		NEC Tokin Corporaton	
		25	Abstract
Issued: February		(Miyagi, JAPAN)	In order to provide an inductance part having excellent DC superposition characteristic and core-loss, a magnetically biasing magnet, which is disposed
15, 2005			in a magnetic gap of a magnetic core, is a bond magnet comprising magnetic powder and plastic resin with the content of the resin being 20% or more on
Expires: Sept 2021			the base of volumetric ratio and which has a specific resistance of 0.1.OMEGAcndot.cm or more. The magnetic powder used is rare-earth magnetic powder having an intrinsic coercive force of 5 kOe or more, Curie point of 300.degree. C. or more, and an average particle size of 2.0-50 .mu.m. A magnetically biasing magnet used in an inductance part that is treated by the reflow soldering method has a resin content of 30% or more and the magnetic powder used therein is SmCo magnetic powder having an intrinsic coercive force of 10 kOe or more, Curie point of 500.degree. C. or more, and an average particle size of 2.5-50 .mu.m. A thin magnet having a thickness of 500 .mu.m or less can be realized for a small-sized inductance part.
			What is claimed is:
			1. A permanent magnet which is a bond magnet comprising [composition of
			matter] a plastic resin and magnetic powder dispersed in the plastic resin without any inorganic glass, wherein said magnet has a specific resistance of
			0.1 .OMEGAcndot.cm or more and said magnetic powder has an intrinsic

		Corporation	Abstract
Issued:			Disclosed herein is a cooling roll which can provide bonded a magnet having
January 4, 2005 Expires: May 2023		(JAPAN)	excellent magnetic properties and having excellent reliability. A melt spinning apparatus is provided with a tube 2 having a nozzle 3 at the bottom thereof, a coil 4 for heating the tube and cooling roll 5 having a circumferential surface 53 in which dimple correcting means is provided. A melt spun ribbon 8 is formed by injecting the molten alloy 6 from the nozzle 3 so as to be collided with the circumferential surface 53 of the cooling roll 5 in an inert gas atmosphere (ambient gas) such as helium gas, so that the molten alloy 6 is cooled and then solidified. In this process, dimples to be produced on a roll contact surface of the melt spun ribbon are divided by the dimple correcting means, thereby preventing formation of huge dimples.
			What is claimed:  1. A ribbon-shaped magnetic material <i>[composition of matter]</i> which is manufactured by colliding a molten alloy to a circumferential surface of a cooling roll so as to cool and then solidify it, comprising: a plurality of ridges
			and grooves formed on a roll contact surface of the ribbon-shaped magnetic material, said grooves having a width in the range of 1-50 µm:
			wherein the plurality of ridges and grooves are transferred to the roll contact surface of the ribbon-shaped magnetic material from the circumferential surface of the cooling roll by dimple correcting means formed on the

			circumferential surface of the cooling roll for dividing dimples that are produced on the roll contact surface of the ribbon-shaped magnetic material which is in contact with the circumferential surface of the cooling roll, the dimple correcting means defined by a plurality of ridges provided by forming a plurality of grooves with an average width of 1-50 μm, the width of the grooves enabling the expelling of a gas that is entered between the molten alloy and the circumferential surface of the cooling roll.  6. A magnetic powder <i>[composition of matter]</i> , which is obtained by milling a ribbon-shaped magnetic material which is manufacturing by colliding a molten alloy to a circumferential surface of a cooling roll so as to a cool and then solidify it, comprising: a composite structure composed of a hard magnetic phase and a soft magnetic phase, an average crystal grain size of each of the hard magnetic phase and the soft magnetic phase being in the range of 1-100 nm; wherein the circumferential surface of the cooling roll has dimple correcting means for dividing dimples to be produced on a roll contact surface of the ribbon-shaped magnetic material which is in contact with the circumferential surface of the cooling roll, the dimple correcting means defined by a plurality of ridges provided by forming a plurality of grooves with an average width of 1-50 μm, the width of the grooves enabling the expelling of a gas that is entered between the molten alloy and the circumferential surface of the cooling roll, and a shape of the plurality of ridges and grooves with the average width of 1-50 μm formed on the circumferential surface of the cooling roll is transferred to a surface of the ribbon-shaped magnetic material after collision of the molten alloy to the cooling roll.

		magnet to give a finished surface. The magnet is then heat treated in an argon,
Expires:		nitrogen or low-pressure vacuum atmosphere having a limited oxygen partial
May 2021		pressure, obtaining a highly oil resistant sintered permanent magnet having
		corrosion resistance and hydrogen barrier property even in a high pressure hot
		environment of refrigerant and/or lubricant as encountered in compressors.
		What is claimed is:
		1. A method [process/method] for preparing a rare earth permanent magnet to
		be exposed to a refrigerant and/or lubricant for an extended period of time,
		comprising the steps of: casting an alloy based on R, T and B, wherein R is
		neodymium or a combination of neodymium with one or more rare earth
		elements, T is iron or a mixture of iron and cobalt, and B is boron, said alloy
		consisting essentially of 17 to 33.5% by weight of neodymium, 26.8 to 33.5%
		by weight of the entire R, 0.78 to 1.25% by weight of B, 0.05 to 3.5% by
		weight of at least one element selected from the group consisting of Ni, Ga, Zr,
		Nb, Hf, Ta, Mn, Sn, Mo, Zn, Pb, Sb, Al, Si, V, Cr, Ti, Cu, Ca and Mg, the
		balance being T and incidental impurities, crushing the alloy in an oxygen-free
		atmosphere of argon, nitrogen or vacuum, followed by comminution,
		compacting under a magnetic field, sintering and aging, thereby yielding a sintered magnet having an oxygen concentration of up to 0.8% by weight, and
		magnetic properties including a residual flux density Br of 12.0 to 15.2 kG and
		a coercive fame iHc of 9 to 35 kOe, cutting and/or polishing the sintered
		magnet to give a sintered magnet with a finished surface, and heat treating the
		sintered magnet with a finished surface in an argon, nitrogen or low-pressure
		vacuum atmosphere having an oxygen partial pressure of 10.sup6 to 10.sup.0
		torr for 10 minutes to 10 hours at a temperature of 200 to 1,100.degree. C.

July 9, 2002		Sumitomo Special	Abstract
Issued:		Metals Co., Ltd.	The method for manufacturing alloy powder for RFeB type rare earth magnets of the present invention includes a first pulverization step of coarsely
March 25, 2003 Expires: July 2022		(JAPAN)	pulverizing a material alloy for rare earth magnets and a second pulverization step of finely pulverizing the material alloy. In the first pulverization step, the material alloy is pulverized by a hydrogen pulverization method. In the second pulverization step, easily oxidized super-fine powder (particle size: 1.0 .mu.m or less) is removed to adjust the particle quantity of the super-fine powder to 10% or less of the particle quantity of the entire powder.
			What is claimed is:
			1. A method for manufacturing alloy powder <i>[process/method]</i> for RFeB rare earth magnets, comprising a first pulverization step of coarsely pulverizing an RFeB alloy for rare earth magnets produced by a rapid cooling method and a second pulverization step of finely pulverizing the material alloy, wherein said second pulverization step comprises a step of removing at least part of the powder in which the concentration of rare earth element is greater than the average concentration of rare earth element contained in the entire powder.
			10. A method for manufacturing an RFeB rare earth magnet comprising the steps of: preparing alloy powder for RFeB rare earth magnets using the method of claim 1; and compacting the alloy powder for RFeB rare earth magnets to produce a permanent magnet.

			11. A method for manufacturing an RFEB rare earth magnet comprising the steps of: preparing first alloy powder for RFeB rare earth magnets using the method of claim 1; preparing second alloy powder for RFeB rare earth magnets different from the first alloy powder in rare earth content; mixing the first alloy powder and the second alloy powder, forming mixed powder; compacting the mixed powder to produce a compact; and sintering the compact to produce a permanent magnet.
Filed: September 22, 2000  Issued: October 22, 2002  Expires: Sept 2020	6,468,440	Assignee:  Kabushiki Kaisha Toshiba  (Kawasaki, JAPAN)	Magnet powder and method for producing the same, and bonded magnet using the same  Abstract  Magnet powder has a composition expressed by (R.sup.1.sub.X R.sup.2.sub.Y B.sub.Z T.sub.100-X-Y-Z).sub.100-Q N.sub.Q (in formula, R.sup.1 is at least one kind of element selected from rare earth elements, R.sup.2 is at least one kind of element selected from Zr, Hf and Sc, T is at least one kind of element selected from Fe and Co, and X, Y, Z and Q are numbers satisfying 2 atomic %.ltoreq.X, 0.01 atomic %.ltoreq.Y, 4.ltoreq.X+Y.gtoreq.20 atomic %,
			0.ltoreq.Z.ltoreq.10 atomic %, and 0.1.ltoreq.Q.ltoreq.20 atomic %, respectively), and TbCu.sub.7 crystal phase as a principal phase. In such magnet powder, a ratio of fine particles of which maximum diameter is 22 .mu.m or less is 20% by weight or less. Alternatively, surface roughness of particles constituting the magnet powder is 5 .mu.m or less in terms of maximum height R.sub.y provided in JIS B 0601-1994. Accordingly, to such a magnet powder, excellent magnetic properties can be obtained with reproducibility.  What is claimed is:
			1. A magnet powder comprising a composition <i>[composition of matter]</i> expressed by:

			general formula:
			$(R^1 {}_x R^2 {}_y B_z T_{100-X-Y-Z})_{100-Q} N_Q$ wherein $R^1$ is at least one kind of element selected from rare earth elements,
			R <sup>2</sup> is at least one kind of element selected from Zr, Hf and Sc, T is at least one kind of element selected from Fe and Co, and X, Y, Z and Q are numbers satisfying 2 atomic $\% \le X$ , 0.01 atomic $\% \le Y$ , $4 \le X + Y \le 20$ atomic $\%$ , $0 \le Z \le 10$ atomic $\%$ , and $0.1 \le Q \le 20$ atomic $\%$ , respectively, and having a TbCu <sub>7</sub> crystal phase as a principal phase; wherein an amount of a fine particle having a maximum diameter of 22 $\mu$ m or less in the magnet powder is 20% by weight or
			less
			18. A method of manufacturing a magnet powder <i>[process/method]</i> , comprising: forming a quenched alloy ribbon having an alloy composition expressed by the general formula: $R^1_x R^2_y B_z T_{100-x-y-z}$
			wherein R <sup>1</sup> is at least one kind of element selected from rare earth elements, R <sup>2</sup> is at least one kind of element selected from Zr, Hf and Sc, T is at least one kind of element selected from Fe and Co, and X, Y and Z are numbers
			satisfying 2 atomic $\% \le X$ , 0.01 atomic $\% \le Y$ , $4 \le X + Y \le 20$ atomic $\%$ , and $0 \le Z \le 10$ atomic $\%$ , by melting the alloy composition and quenching the molten alloy composition, the quenched alloy ribbon having a TbCu <sub>7</sub> crystal phase as a principal phase and having an average surface area S of 0.5
			mm <sup>2</sup> /particle or more: and
			nitriding the quenched alloy ribbon by heating in an atmosphere containing nitrogen to form a magnet powder having a flake shape.

Expires:		zones near a melting/evaporating source and the work within a treating
March		
		chamber. Thus, the vapor deposited film can be formed stably on the surface of
2022		a desired work without requirement of a long time for providing a high degree
		of vacuum and without use of a special apparatus. In addition, the use of the
		surface treating process ensures that a corrosion resistance can be provided to a
		rare earth metal-based permanent magnet extremely liable to be oxidized,
		without degradation of a high magnetic characteristic of the magnet. A surface
		treating apparatus according to the present invention includes a
		melting/evaporating source for melting and evaporating a wire-shaped vapor-
		depositing material containing a vapor deposition controlling gas, and a
		member for retaining a work on which the vapor-depositing material is
		deposited. The melting/evaporating source and the work retaining member are
		disposed in a treating chamber of the surface treating chamber. The apparatus
		further includes a vapor-depositing material supply means for supplying the
		wire-shaped vapor-depositing material containing the vapor deposition
		controlling gas to the melting-evaporating source.
		What is claimed is:
		1. A work having a vapor deposited film formed thereon from at least one
		metal selected from the group consisting of aluminum, titanium, zinc, tin, lead
		and bismuth by [process/method] a surface treating process for forming a
		vapor deposited film from an easily oxidizable vapor-depositing material on
		the surface of the work, comprising the step of evaporating the vapor-
		the surface of the work, comprising the step of evaporating the vapor-

			depositing material in a state in which a vapor deposition controlling gas has been supplied to at least zones near a material melting/evaporating source and the work within a treating chamber such that said vapor deposited film contains hydrogen in a range from 1 ppm to 20 ppm.  2. A work according to claim 1, wherein said work is a rare earth metal-based permanent magnet.
Filed:	6,602,352	Assignee:	Method for manufacturing rare earth magnet and powder compacting apparatus
June 27, 2001 Issued: August 5, 2003 Expires: June 2021		Sumitomo Special Metals Co., Ltd. (JAPAN)	Abstract A method and apparatus for manufacturing a rare earth magnet is disclosed. In a first step, a compact is produced by compacting rare earth alloy powder in a predetermined space in an orienting magnetic field. Next, a demagnetizing process is performed for the compact, and the compact is ejected from the predetermined space. Then, a additional demagnetizing process is performed for magnetic powder adhering to a surface of the compact by applying an magnetic field to the compact after the compact is ejected.
			What is claimed is:  1. A method for manufacturing a rare earth magnet [process/method] comprising: a first step of producing a compact by compacting rare earth alloy powder in a predetermined space in an orienting magnetic field; a second step of performing a demagnetizing process for the compact by applying a first magnetic field to the compact; a third step of ejecting the compact from the predetermined space after the second step; and a fourth step of performing a demagnetizing process for magnetic powder adhering to a surface of the compact by applying a second magnetic field to the compact after the third step.

Filed: February	6,555,018	Assignee:	Bonded magnets made with atomized permanent magnetic powders
28, 2001		Magnequench, Inc.	Abstract The invention relates to magnets, particularly bonded magnets, of the ReFe
Issued: April 29, 2003  Expires: Feb 2021		(Indianapolis, IN, USA)	B type made from atomized magnetic powders and to methods of producing the powders and the magnet. The magnetic powders comprise, by weight, about 15% to 25% of RE; about 0.8% to 2.0% of B; about 1% to 10% of T; and balanced with Fe, Co, or mixtures thereof; wherein RE is one or more rare earth elements selected from the group consisting of Y, La, Ce, Pr, Nd, Sm, Er, Gd, Tb, Dy, Ho, Tm, Yb and Lu, and T is one or more elements selected from the group consisting of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, and W. To produce bonded magnets, the atomized powders are heat treated, combined with a binder, pressed or molded, and cured to produce the bonded magnets. As compared to bonded magnets made from melt-spun powders or from other conventional atomized powders, bonded magnets of the present invention exhibit one or more of the following properties: less loss of intrinsic coercivity under repeated injection molding cycles; less internal magnetic shearing loss; improved flowability of the magnetic powders; improved Br and part integrity; less environmental degradation after exposure to high temperature and less flux loss; complex shapes and high part integrity; lower viscosity of the magnetic powder-binder mixtures; and high magnetic strength even for small-dimension magnets.  What is claimed is:
			1. A bonded magnet made from magnetic powders obtained by an atomization

			process <i>[process/method]</i> , said powders comprising <i>[composition of matter]</i> , by weight, above 15% to about 25% of RE; about 0.8% to about 2.0% of B; about 1% to about 10% of T; and balanced with Fe, Co, or mixtures thereof, wherein RE is one or more rare earth elements selected from the group consisting of Y, La, Ce, Pr, Nd, Sm, Er, Gd, Tb, Dy, Ho, Tm, Yb and Lu; and T is one or more elements selected from the group consisting of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, and W; and wherein the magnetic powders comprise a metallurgically complex structure substantially having the formula of Nd.sub.2 Fe.sub.14 B as the primary magnetic phase.

method. The sintered permanent magnet can be imparted with greatly improved magnetic properties or, in particular, residual magnetic flux density when the thin alloy ribbon as the base material thereof has a metallographic phase structure containing "four-phase regions" consisting of (a) an .alpha.-iron phase, (b) a R-rich phase, in which R is a rare earth element selected from praseodymium, neodymium, terbium and dysprosium, (c) a R.sub.x T.sub.4 B.sub.4 phase, in which T is iron or a combination of iron and a transition metal element other than iron and rare earth elements and x is a positive number varying with the rare earth element, and (d) a R.sub.2 T.sub.14 B phase, in which R and T each have the same meaning as defined above, each phase being dispersed with a grain diameter in a limited range, in a volume fraction of from 1 to 10%.

## What is claimed is:

1. A rare earth-based permanent magnet which is [composition of matter] a sintered body of a powder of a thin ribbon of a rare earth-based magnet alloy, having a metallographic phase structure of which the volume fraction of a four-phase region consisting of (a) an  $\alpha$ -iron phase having  $\alpha$ -iron grains with a grain diameter of 0.1 to 20 µm, (b) an R-rich phase which is a phase richer in the content of rare earth element than in an R<sub>2</sub>T<sub>14</sub>B phase, R being a rare earth element selected from praseodymium, neodymium, terbium and dysprosium, said R-rich phase having R-rich grains with a grain diameter of 0.1 to 20 µm, (c) an R<sub>x</sub>T<sub>4</sub>B<sub>4</sub> phase, in which R has the same meaning as defined above, T is iron or a combination of iron and a transition metal element other than iron and the rare earth elements and x is a positive number larger than 1 varying with the rare earth element, said R<sub>x</sub>T<sub>4</sub>B<sub>4</sub> phase having R<sub>x</sub>T<sub>4</sub>B<sub>4</sub> grains with a grain diameter of 0.1 to 10 µm and (d) the R<sub>2</sub>T<sub>14</sub>B phase, in which R and T each have the same meaning as defined above, the  $R_2T_{14}B$  phase having  $R_2T_{14}B$ grains with a grain diameter of 0.1 to 20 µm, each phase being uniformly dispersed in the four-phase region, is in the range from 1 to 20% by volume,

			with the proviso that the rest of the volume fraction consists of the R-rich phase, R <sub>x</sub> T <sub>4</sub> B <sub>4</sub> phase and R <sub>2</sub> T <sub>14</sub> B phase or consists of the R-rich phase and R <sub>2</sub> T <sub>14</sub> B phase.  5. The rare earth-based permanent magnet as claimed in claim 1wherein the powder is obtained [process/method] by hydrogen decrepitation and pulverization of the thin ribbon of a rare earth-based magnet alloy.
Filed:	6,524,399	Assignee:	Magnetic material
Issued: February 25, 2003  Expires: March 2019		Pioneer Metals and Technology, Inc. (Boston, MA, USA)	Abstract Magnetic materials having a coercivity not less than about 1000_Oersted are prepared in a single step procedure. A molten mixture of a desired composition having a relatively high boron content is cooled at a rate slower than about 105 degrees Celsius per second. Preferably, the molten mixture is cooled by depositing it on a chilled surface such that it forms a layer between about 120 and about 300, and preferably between about 120 and about 150, microns thick.  What is claimed is:  1. The method of [process/method] producing a magnetic material comprising the steps of: providing a molten mixture including boron, one or more rare earths and one or more transition metals; and cooling said mixture at a rate slower than about 10.sup.5 degrees Celsius per second and faster than about 10.sup.4 Celsius per second, the molten mixture containing not less than about ten atomic percent boron, not less than about 60 atomic percent transition metals, and not more than about 10 atomic percent rare earths, wherein at least about 90 percent by weight of said rare earths comprise Nd, Pr, or a mixture thereof.

			2. The method of claim 1 wherein said molten mixture is cooled by impinging said molten mixture on a heat conducting surface so that said mixture forms a layer having a thickness between about 120 and about 300 microns.

		Magnequench,Inc.	
Issued:			Isotropic rare earth material of high intrinsic induction
November		(Anderson, IN, USA)	
12, 2002			Abstract
			Isotropic magnetic alloy powder having an intrinsic magnetic induction of at least two third of its magnetic remanence and method for making same are
Expires:			provided. The powder is made from an alloy having a composition comprising,
December, 2017			by weight percentage, approximately 15 to 35 percent of one or more rare earth
2017			metals, approximately 0.5 to 4.5 percent of boron, and approximately 0 to 20 percent of cobalt, balanced with iron. The alloy powder is made by a process
			wherein an amount of the alloy is melt and spun in an inert environment,
			preferably at a distance between an orifice and a wheel being less than one and
			one half inches, into ribbons, followed by crushing the ribbons into powder and annealing the powder.
			What is claimed is:
			1. Isotropic magnetic material comprising [composition of matter] one or
			more are earth metals, boron, and iron, said magnetic material having an
			intrinsic magnetic induction, when measured at two third of its intrinsic
			coercivity and without taking into consideration of demagnetization correction
			factor, of at least two-thirds of its magnetic remanence; wherein said magnetic
			material comprises niobium in an amount of less than 0.1%, by weight, and gallium in an amount of less than 0.01%, by weight.
			3. The magnetic material of claim 1 wherein said intrinsic magnetic induction

			is at least 75 percent of its magnetic remanence.
			4. The magnetic material of claim 1 having been made by a process [process/method] comprising a melt spinning step
Filed: September 15, 2000  Issued: October 29, 2002  Expires: Sept 2020	6,471,786	Assignee: Sumitomo Special Metals Co., Ltd. (JAPAN)	Method for preparing nanocomposite magnet powder and method for producing nanocomposite magnet  Abstract  The inventive method for preparing nanocomposite magnet powder includes the step of preparing material alloy powder for a nanocomposite magnet represented by a general formula Fe.sub.100-x-y-z-u R.sub.x B.sub.y Co.sub.z M.sub.u where R is a rare-earth element of which 90-100 atomic percent is Pr and/or Nd while 0-10 atomic percent is another lanthanoid and/or Y, and the molar fractions x, y, z and u meet the inequalities of 2.ltoreq.x.ltoreq.6, 16.ltoreq.y.ltoreq.20, 0.2.ltoreq.z.ltoreq.7 and 0.01.ltoreq.u.ltoreq.7, respectively. The powder includes a metastable phase and an amorphous structure existing in a metal structure. Heat treatment is performed for the material alloy powder to crystallize Fe.sub.3 B and FeRB compounds from the amorphous structure. An integral value of the difference between a temperature-time curve represented by the temperature of the material alloy powder as a function of the heat treatment time during the heat treatment and a reference temperature-time curve is in a range from 10.degree. Cmultidot.sec to 10,000.degree. Cmultidot.sec, the reference temperature-time curve being obtained when heat treatment similar to the above heat treatment is performed for an equivalent amount of alloy that has the same composition as the material alloy but does not include the amorphous structure.  What is claimed is:  1. A method for preparing nanocomposite magnet powder [process/method],
			1.11 medies for preparing nunocomposite magnet powder [process/memos],

			the method comprising the steps of: preparing material alloy powder for a nanocomposite magnet, the powder being represented by a general formula Fe.sub.100-x-y R.sub.x B.sub.y, Fe.sub.100-x-y-z R.sub.x B.sub.y Co.sub.z, Fe.sub.100-x-y-u R.sub.x B.sub.y M.sub.u or Fe.sub.100-x-y-z-u R.sub.x B.sub.y Co.sub.z M.sub.u where R is a rare-earth element; 78-100 atomic percent of R is Pr and/or Nd, 0-22 atomic percent of R is another lanthanoid and/or Y; M is at least one element selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Ni, Cu, Ga, Zr, Nb, Mo, Hf, Ta, W, Pt, Pb, Au and Ag; the molar fractions x, y, z and u meet the inequalities of 2.ltoreq.x.ltoreq.6, 16.ltoreq.y.ltoreq.20, 0.2.ltoreq.z.ltoreq.7 and 0.01.ltoreq.u.ltoreq.7, respectively, the powder including a metastable phase and an amorphous structure existing in a metal structure; and heat-treating said material alloy powder to crystallize Fe.sub.3 B and FeRB compounds from the amorphous structure, wherein an integral value of the difference between a temperature-time curve represented by the temperature of the material alloy powder for the nanocomposite magnet and the heat treatment time in the step of heat-treating the material alloy powder for the nanocomposite magnet and a reference temperature-time curve is in a range from 10.degree. Cmultidot.sec to 10,000.degree. Cmultidot.sec, said reference temperature-time curve being obtained by heat-treating said material alloy powder for said nanocomposite magnet for an equivalent amount of alloy having the same composition as said material alloy for the nanocomposite magnet without said amorphous structure.

Filed: November	6,447,621	Assignee:	R-T-B rare earth sintered magnet having improved squareness ratio and method for producing same
24, 1999		Hitachi Metals, Ltd.	
			Abstract
Issued: September 10, 2002		(Tokyo, JAPAN)	An RTB rare earth sintered magnet containing an R.sub.2 T.sub.14 B-type intermetallic compound as a main phase and thus having improved squareness ratio is produced by carrying out a reduction and diffusion method comprising
г .			the steps of (a) mixing oxide powder of at least one rare earth element R, T-
Expires: Nov 2019			containing powder, wherein T is Fe or Fe and Co, B-containing powder, and a reducing agent such as Ca, (b) heating the resultant mixture at 900-
1107 2019			1350.degree. C. in a non-oxidizing atmosphere, (c) removing reaction by-
			products from the resultant reaction product by washing, and (d) carrying out a
			heat treatment for Ca removal by heating the resultant RTB rare earth alloy
			powder at 900-1200.degree. C. in vacuum at 1 Torr or less, followed by
			pulverization of the resultant alloy powder bulk, molding, sintering in vacuum,

heat treatment, and surface treatment. The alloy powder bulk obtained by the heat treatment for Ca removal is preferably pulverized after removal of its surface layer.

What is claimed is:

1. An R--T--B rare earth sintered magnet formed from R--T--B alloy powder *[composition of matter]* produced by a reduction and diffusion method, which R--T--B rare earth sintered magnet has an improved squareness ratio and contains as a main phase an R.sub.2 T.sub.14 B-type intermetallic compound, wherein R is at least one rare earth element including Y, at least one of Nd, Dy and Pr being indispensable, and T is Fe or Fe and Co, the amount of Ca contained as an inevitable impurity being 0.01 weight % or less, and c-axis directions of core portions of the main-phase crystal grain particles being deviated by 5.degree. or more from those of surface layer portions of the main phase crystal grain particles, wherein the number of said main phase crystal grain particles each having a surface layer portion is 50% or less of the total number of said main phase crystal grain particles.

7. The R--T--B rare earth sintered magnet according to claim 1, wherein said reduction and diffusion method *[process/method]* comprises the steps of: (a) a mixing oxide powder of at least one rare earth element R, wherein R is at least one rare earth element including Y, at least one of Nd, Dy and Pr being indispensable, T-containing powder, wherein T is Fe or Fe and Co, B-containing powder, and at least one reducing agent selected from the group consisting of Ca, Mg and hydrides thereof, (b) heating the resultant mixture at 900-1350.degree. C. in a non-oxidizing atmosphere, (c) removing reaction byproducts from the resultant reaction product by washing, and (d) carrying out a heat treatment for Ca removal by heating the resultant R--T--B rare earth alloy powder at 900-1200.degree. C. in vacuum at 1 Torr or less, followed by pulverization of the resultant alloy powder bulk, molding, sintering in vacuum,

Filed: March 16, 2000	6,387,293	Assignee: Seiko Epson Corporation	Composition for rare earth bonded magnet use, rare earth bonded magnet and method for manufacturing rare earth bonded magnet
			Abstract
Issued: 6,387,293  Expires: March 2020		(JAPAN)	A composition for a rare earth bonded magnet, the rare earth bonded magnet and the method for manufacturing the rare earth bonded magnet are provided that produce little decline in mechanical strength caused by the addition of a lubricant and have excellent molding properties. The rare earth bonded magnet of the present invention is manufactured from the composition for the magnet that contains rare earth magnetic powder, binding resin containing thermoplastic resin, and fluorine-based resin powder, by compaction molding, extrusion molding or injection molding. The fluorine-based resin powder has the properties of improving mainly lubrication between a molding and a metallic mold. The content of the fluorine-based resin powder in the composition for the rare earth bonded magnet is preferably less than 20 vol % relative to the thermoplastic resin, and the particle diameter of the fluorine-based resin powder is preferably 2-30 .mu.m.

			What is claimed is:
			1. A composition for a rare earth bonded magnet <i>[composition of matter]</i> comprising rare earth magnetic powder and binding resin containing thermoplastic resin; wherein the composition comprises fluorine-based resin powder with a particle size of 2-30 .mu.m and 2-12 vol % of an antioxidant.
			6. A rare earth bonded magnet prepared by <i>[process/method]</i> bonding rare earth magnetic powder with binding resin containing thermoplastic resin; wherein the magnet contains fluorine-based resin powder with a particle size of 2-30 .mu.m;
			said rare earth bonded magnet has a rare earth magnetic powder content of 68-76 vol % when prepared by an injection molding method; and
			said rare earth bonded magnet has a rare earth magnetic powder content of 78.1-83 vol % when prepared by an extrusion molding method.

12, 1999		General Electric Company	Abstract A permanent magnet for an MRI scanner is made by removing extraneous
Issued:			elements from an ore containing rare earth elements to leave elements Pr and
April 23,		(Schenectady, NY,	Nd therein, and then selectively stripping therefrom a portion of the element
2002		USA)	Nd as a byproduct to leave an ore residuum including both elements Pr and Nd therein. The residuum is alloyed with a transition metal to form an alloy
Expires: Feb 2019			therewith. The alloy is then formed into a rare earth permanent magnet configured for use in the MRI scanner.
			1. A method of making [process/method] a permanent magnet comprising:
			providing ore containing rare earth elements including Ce, Nd, and Pr;
			partially removing said element Ce from said ore;
			removing extraneous elements from said ore to leave elements Ce, Pr, and Nd therein;
			selectively stripping from said ore a portion of said element Nd as a byproduct to leave an ore residuum including elements Ce, Pr, and Nd;
			alloying said residuum with a transition metal to form an alloy therewith; and

	I	Τ	
			forming said residuum alloy into a mixed rare earth permanent magnet.
			2. A method according to claim 1 wherein said element Pr is not stripped from said ore and remains in said residuum.
Filed: February 1,	6,338,761	Assignee:	Iron-based permanent magnets and their fabrication as well as iron-based permanent magnet alloy powders for permanent bonded magnets and iron-
2000		Sumitomo Special Metals Co., Ltd.	based bonded magnets
Issued:			Abstract
January 15, 2002		(Osaka, JAPAN)	With the intention of establishing fabrication methods for cheaply produced (Fe,Co)CrBR-type bonded magnets or (Fe,Co)CrBRM-type bonded magnets containing few rare earth elements and having a coercive force iHc
Expires:			above 5 kOe and a residual magnetic flux density Br above 5.5 kG matching
Feb 2020			the cost performance of hard ferrite magnets, we have obtained iron-based
			permanent magnets consisting of microcrystal clusters where the average
			crystal size of each component phase is in the range 1 nm .about.30 nm and
			where both a soft magnetic phase consisting of a ferromagnetic alloy whose
			main components are .alphaFe and a ferromagnetic alloy having iron, and a
			hard magnetic phase having a Nd.sub.2 Fe.sub.14 B-type crystal structure
			coexist within the same powder particles, by melt-quenching of a (Fe,Co)Cr
			BR(Pr,Nd)-type molten alloy or a (Fe,Co)CrBRM (M=Al,Si,S,Ni,
			Cu,Zn,Ga,Ag,Pt,Au,Pb)-type molten alloy of a particular composition
			containing few rare earth elements, to obtain an essentially amorphous
			structure or a structure both amorphous and with small amounts of fine
			crystals, and by applying a crystallization heat treatment under specific
			conditions. By grinding this iron-based permanent magnet to an average
			powder particle size of 3 .mu.m.about.500 .mu.m and combining the resultant
			iron-based permanent magnet alloy powder with a resin, we can obtain an iron-
			based bonded magnet with good thermal and magnetic properties and with the

magnetic characteristics iHc.gtoreq.5 kOe, Br.gtoreq.5.5 kG and (BH)max.gtoreq.6 MGOe.

## What is claimed is:

- 1. A method for manufacturing *[process/method]* an iron-base permanent magnet consisting of fine crystal aggregates of mutually distributed magnetically soft and hard magnetic phases, comprising:
- (a) providing a molten metal mixture whose composition is represented by the formula  $Fe_{100-x-y-z-a}Cr_xB_yR_zCo_a$ , wherein R is Pr or Nd or mixtures thereof and wherein x, y, z and a satisfy the following values:

0.01≦x≦at %

15≦y≦30 at %

3≦z≦6 at %

 $0.01 \le a \le 30$  at %;

- (b) rapidly solidifying said molten metal mixture into an amorphous material or essentially amorphous material containing fine crystals dispersed in an amorphous matrix, and then
- (c) heat treating the resulting rapidly solidified material for crystallization of the amorphous material or the essentially amorphous material at a heating rate between  $10^{\circ}$  C./min and  $50^{\circ}$  C./sec from near a temperature at which crystallization starts to an isothermal heat treatment temperature of  $600^{\circ}$  C. to  $750^{\circ}$  C. to produce a magnetically hard material wherein a soft magnetic phase consisting of  $\alpha$ -iron and a ferromagnetic phase having iron as a main component and a hard magnetic phase having a  $Nd_2Fe_{14}B$  tetragonal crystal structure coexist in the iron-base permanent magnet,

provided that the hard magnetic phase having the Nd<sub>2</sub>Fe<sub>14</sub>B tetragonal crystal structure is not a primary phase of said iron-base permanent magnet, the

			constituent phases of said iron-base permanent magnet having a mean crystal size within the range of 1 nm to 30 nm.

Filed: April 12, 1999	6,328,817	Assignee: Santoku Metal Industry	Powder for permanent magnet, method for its production and anisotropic permanent magnet made using said powder
		Co., Ltd.	Abstract
Issued:			There is provided a powder for permanent magnet comprising needle-like fine
December 11, 2001		(Kobe, JAPAN)	particles of Fe or FeCo alloy as a base material, a hard magnetic layer and a separation layer of an oxide of rare earth element provided outside said hard magnetic layer.
Expires:			
April 2019			What is claimed is:
			1. A powder for a permanent magnet comprising <i>[composition of matter]</i> fine particles with a major axis and a minor axis of 0.1 to 3 μm and 0.03 to 0.4 μm, respectively, of an Fe or Fe—Co alloy as a base material, a hard magnetic layer containing Fe, Sm and N provided on a surface of said fine particles, and a separation layer of an oxide of R provided outside said hard magnetic layer, wherein R represents one or more rare earth elements selected from the group consisting of Nd, La, Ce, Pr, Sm, and Y.
			4. A method for producing <i>[process/method]</i> a powder for a permanent magnet, which comprises coating a surface of Fe fine particles or Fe—Co alloy fine particles, said fine particles having a major axis of 0.1 to 3 μm and a minor axis of 0.03 to 0.4 μm, with a hydroxide of R by a wet deposition method;

			subjecting the fine particles to filtration and drying; heat-treating the dried fine particles in an atmosphere of a hydrogen gas, an inert gas, or a mixture thereof; coating the resultant Fe fine particles or Fe—Co alloy fine particles coated with an oxide of R with Sm in a vacuum at a temperature of 500 to 1000° C.; further heat-treating the fine particles to form a compound layer containing Fe and Sm on the surface of the Fe fine particles or Fe—Co alloy fine particles; and subjecting the heat-treated fine particles to a nitriding treatment in a nitrogen-containing gas; wherein R represents one or more rare earth elements selected from the group consisting of Nd, La, Ce, Pr, Sm, and Y.
Filed: June 7, 2000 Issued: November 27, 2001 Expires: June 2020	6,322,637	Assignee: Shin-Etsu Chemical Co., Ltd.  (Tokyo, JAPAN)	Abstract Disclosed is a thin alloy ribbon prepared by the strip casting method as an intermediate for the preparation of a sintered rare earth-based permanent magnet or in particular, a neodymium/iron/boron-type permanent magnet. The thin alloy ribbon is characterized by a specific volume fraction of the four-phase coexisting region consisting of the .alphairon phase, R-rich phase, R.sub.x T.sub.4 B.sub.4 phase and R.sub.2 T.sub.14 B phase each having an average grain diameter in a specified range and a specific volume fraction of the chill crystalline phase. When these requirements are satisfied, the sintered rare earth-based permanent magnet prepared from the thin alloy ribbons can be imparted with improved magnetic properties and high sintering density even without increasing the sintering temperature.
			What is claimed is:  1. A thin alloy ribbon prepared by [process/method] the strip casting method from a melt of an alloy comprising a rare earth element R selected from the

			group consisting of praseodymium, neodymium, terbium and dysprosium, element T which is iron or a combination of iron with a transition metal element other than iron and rare earth elements and boron B, which comprises from 1 to 10% by volume fraction of a four-phase coexisting region consisting of an .alphairon phase having an average grain diameter of 0.1 to 20 .mu.m, R-rich phase having an average grain diameter of 0.1 to 20 .mu.m, R.sub.x T.sub.4 B.sub.4 phase, the subscript x being a number larger than 1 but smaller than 1.2, having an average grain diameter of 0.1 to 10 .mu.m and R.sub.2 T.sub.14 B phase having an average grain diameter of 0.1 to 20 .mu.m and from 1 to 30% by volume fraction of a chill crystalline phase having an average grain diameter not exceeding 3 .mu.m, the balance of the volume fractions consisting of a combination of the R-rich phase, R.sub.x T.sub.4 B.sub.4 phase and R.sub.2 T.sub.14 B phase or a combination of the R-rich phase and R.sub.2 T.sub.14 B phase.
			2. The thin alloy ribbon as claimed in claim 1 in which <i>[composition of matter]</i> the average grain diameters of the .alphairon phase, R-rich phase, R.sub.x T.sub.4 B.sub.4 phase and R.sub.2 T.sub.14 B phase are in the ranges from 0.1 to 10 .mu.m, from 0.1 to 10 .mu.m and from 0.1 to 10 .mu.m, respectively.

February			
11, 2000		Shin-Etsu Chemical	Abstract
T 1		Co., Ltd.	Disclosed is a novel thin ribbon of a rare earth/iron/boron-based magnet alloy
Issued:		(Tolmo IADANI)	prepared by quenching of an alloy melt by the method of strip casting, from
November		(Tokyo, JAPAN)	which a sintered permanent magnet is obtained by the powder metallurgical
20, 2001			method. The sintered permanent magnet can be imparted with greatly improved magnetic properties or, in particular, residual magnetic flux density
Expires:			when the thin alloy ribbon as the base material thereof has a metallographic
Feb 2020			phase structure containing "four-phase regions" consisting of (a) an .alpha

iron phase, (b) a R-rich phase, in which R is a rare earth element selected from praseodymium, neodymium, terbium and dysprosium, (c) a R.sub.x T.sub.4 B.sub.4 phase, in which T is iron or a combination of iron and a transition metal element other than iron and rare earth elements and x is a positive number varying with the rare earth element, and (d) a R.sub.2 T.sub.14 B phase, in which R and T each have the same meaning as defined above, each phase being dispersed with a grain diameter in a limited range, in a volume fraction of from 1 to 10%.

## What is claimed is:

1. A thin ribbon of a rare earth-based magnet alloy [composition of matter], having a metallographic phase structure of which the volume fraction of a four-phase region consisting of (a) an .alpha.-iron phase having .alpha.-iron grains with a grain diameter of 0.1 to 20 .mu.m, (b) an R-rich phase which is a phase richer in the content of rare earth element than in an R.sub.2 T.sub.14 B phase, R being a rare earth element selected from praseodymium, neodymium, terbium and dysprosium, said R-rich phase having R-rich grains with a grain diameter of 0.1 to 20 .mu.m, (c) an R.sub.x T.sub.4 B.sub.4 phase, in which R has the same meaning as defined above, T is iron or a combination of iron and a transition metal element other than iron and the rare earth elements and x is a positive number larger than 1 varying with the rare earth element, said R.sub.x T.sub.4 B.sub.4 phase having R.sub.x T.sub.4 B.sub.4 grains with a grain diameter of 0.1 to 10 .mu.m and (d) the R.sub.2 T.sub.14 B phase, in which R and T each have the same meaning as defined above, the R.sub.2 T.sub.14 B phase having R.sub.2 T.sub.14 B grains with a grain diameter of 0.1 to 20 .mu.m, each phase being uniformly dispersed in the four-phase region, is in the range from 1 to 20% by volume, with the proviso that the rest of the volume fraction consists of the R-rich phase, R.sub.x T.sub.4 B.sub.4 phase and R.sub.2 T.sub.14 B phase or consists of the R-rich phase and R.sub.2 T.sub.14

		B phase.
		5. A powder of a rare earth-based magnet alloy which is a product obtained by <i>[process/method]</i> hydrogen decrepitation and pulverization of the thin ribbon of a rare earth-based magnet alloy defined in claim 1.
Filed: December 6, 1999  Issued: October 16, 2001  Expires: Dec 2019	Assignee: Sumitomo Special Metals Co., LTD (JAPAN)	Nanocomposite magnet material and method for producing nanocomposite magnet  Abstract An inventive material alloy for a nanocomposite magnet is represented by a general formula Fe.sub.100-x-y R.sub.x B.sub.y, Fe.sub.100-x-y-z R.sub.x B.sub.y Co.sub.z, Fe.sub.100-x-y-u R.sub.x B.sub.y M.sub.u or Fe.sub.100-x-y-z-u R.sub.x B.sub.y Co.sub.z M.sub.u. R is a rare-earth element. 90 atomic percent or more of R is Pr and/or Nd, while equal to or larger than 0 atomic percent and less than 10 atomic percent of R is another lanthanoid and/or Y. M is at least one element selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Ni, Cu, Ga, Zr, Nb, Mo, Hf, Ta, W, Pt, Pb, Au and Ag. The molar fractions x, y, z and u meet the inequalities of 2.ltoreq.x.ltoreq.6, 16.ltoreq.y.ltoreq.20, 0.2.ltoreq.z.ltoreq.7 and 0.01.ltoreq.u.ltoreq.7, respectively. The alloy includes a metastable phase Z represented by at least one of a plurality of Bragg reflection peaks observable by X-ray diffraction analysis. The at least one peak corresponds to a lattice spacing of 0.179 nm.+0.005 nm. An intensity of the Bragg reflection peak represents 5 to 200 percent, both inclusive, of a maximum intensity of a halo pattern. An intensity of a (110) Bragg reflection peak of body-centered Fe represents less than 5 percent of the maximum intensity of the halo pattern.  What is claimed is:  1. A material alloy [composition of matter] for a nanocomposite magnet, the alloy being represented by a general formula Fe <sub>100-x-y</sub> R <sub>x</sub> B <sub>y</sub> ,

Fe $_{100-x-y-z}R_xB_yCo_z$ , Fe $_{100-x-y-u}R_xB_yM_u$  or Fe $_{100-x-y-z-u}R_xB_yCo_zM_u$ , where R is a rare-earth element, 90 atomic percent or more of R being Pr and/or Nd, while equal to or larger than 0 atomic percent and less than 10 atomic percent of R being another lanthanoid and/or Y, M is at least one element selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Ni, Cu, Ga, Zr, Nb, Mo, Hf, Ta, W, Pt, Pb, Au and Ag, and the molar fractions x, y, z and u meet the inequalities of  $2 \le x \le 6$ ,  $16 \le y \le 20$ ,  $0.2 \le z \le 7$  and  $0.01 \le u \le 7$ , respectively, and wherein the alloy includes a metastable phase Z represented by at least one of a plurality of Bragg reflection peaks observable by X-ray diffraction analysis, the at least one peak corresponding to a lattice spacing of  $0.179 \text{ nm} \pm 0.005 \text{ nm}$ , an intensity of the Bragg reflection peak representing 5 to 200 percent, both inclusive, of a maximum intensity of a halo pattern, and wherein an intensity of a (110) Bragg reflection peak of body-centered Fe represents less than 5 percent of the maximum intensity of the halo pattern.

3. A method for preparing *[process/method]* a material alloy for a nanocomposite magnet, the alloy being represented by a general formula  $Fe_{100-x-y}R_xB_y$ ,  $Fe_{100-x-y-z}R_xB_yCo_z$ ,  $Fe_{100-x-y-u}R_xB_yM_u$  or  $Fe_{100-x-y-z-u}R_xB_yCo_zM_u$ , where R is a rare-earth element; 90 atomic percent or more of R is Pr and/or Nd, while equal to or larger than 0 atomic percent and less than 10 atomic percent of R is another lanthanoid and/or Y; M is at least one element selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Ni, Cu, Ga, Zr, Nb, Mo, Hf, Ta, W, Pt, Pb, Au and Ag; the molar fractions x, y, z and u meet the inequalities of  $2 \le x \le 6$ ,  $16 \le y \le 20$ ,  $0.2 \le z \le 7$  and  $0.01 \le u \le 7$ , respectively,

the method comprising the steps of forming a melt of the material alloy, and rapidly quenching and solidifying the melt,

wherein a cooling rate of the alloy is adjusted in the rapid quenching and solidifying step such that the material alloy solidified includes a metastable

			phase Z represented by at least one of a plurality of Bragg reflection peaks observable by X-ray diffraction analysis, the at least one peak corresponding to a lattice spacing of 0.179 nm±0.005 nm, an intensity of the Bragg reflection peak representing 5 to 200 percent, both inclusive, of a maximum intensity of a halo pattern, an intensity of a (110) Bragg reflection peak of body-centered Fe representing less than 5 percent of the maximum intensity of the halo pattern.

Expires: Oct 2018	nanocrystal dispersion. The compositions and methods provide advantages in that materials with superior properties are provided.
	What is claimed is:
	1. A nanocrystal dispersed amorphous alloy composition <i>[composition of matter]</i> comprising:
	aluminum;
	at least one transition metal;
	at least one rare earth element;
	at least one crystallization agent that is immiscible in an amorphous precursor mixture of said aluminum, said at least one transition metal, and said at least one rare earth element, and
	at least one element selected from the group consisting of tin and calcium.
	7. A nanocrystal dispersed amorphous alloy composition <i>[composition of matter]</i> comprising:
	iron:
	neodymium;
	boron;
	at least one crystallization agent that is immiscible in an amorphous precursor mixture of said iron, said neodymium and said boron, and

			a flux including phosphorous, and wherein said boron is present in an amount of from approximately 1 at. % to approximately 8 at. %.
Filed: September 16, 1998  Issued: July 17, 2001  Expires: Sept 2018	6,261,385	Assignee: Shin-Etsu Chemical Co., Ltd. (Tokyo, JAPAN)	Abstract Disclosed is a novel magnetically anisotropic rare earth-based permanent magnet having a nanocomposite structure consisting of a hard magnetic phase such as Nd.sub.2 Fe.sub.14 B and a soft magnetic phase such as bcc-iron, Fe.sub.3 B and Fe.sub.2 B in a volume ratio of 10:90 to 90:10 uniformly dispersed each in the other in a fineness of a few tens nanometers, in which particles of the hard magnetic phase are aligned in a direction relative to the easy magnetization axes of the particles. Such an anisotropic permanent magnet can be prepared by the method comprising: preparing a starting amorphous alloy of a composition susceptible to dispersion precipitation of the hard magnetic phase, for example, by the melt-spun method; forming the amorphous alloy into a magnet block; heating the magnet block at 600 to 1000.degree. C. to effect dispersion precipitation of the hard magnetic phase; and deforming the magnet block at the elevated temperature by compression unidirectionally so that the particles of the hard magnetic phase are aligned relative to the easy magnetization axes of the particles.
			What is claimed is:  1. A magnetically anisotropic rare earth-based permanent magnet having a nanocomposite structure <i>[composition of matter]</i> consisting of a hard magnetic phase and a soft magnetic phase finely and uniformly dispersed each

in the other in a volume ratio in the range from 10:90 to 90:10, particles of the hard magnetic phase being aligned in a direction relative to the easy magnetization axes of the particles, wherein the hard magnetic phase has a chemical composition of the formula Sm.sub.2 Co.sub.17 or Sm.sub.2 (Fe,Co).sub.17 and the soft magnetic phase is cobalt or a Fe--Co alloy.

- 5. A method *[process/method]* for the preparation of a magnetically anisotropic rare earth-based permanent magnet having a nanocomposite structure consisting of a hard magnetic phase and a soft magnetic phase in a volume ratio in the range from 10:90 to 90:10 finely and uniformly dispersed each in the other, particles of the hard magnetic phase being aligned in a direction relative to the easy magnetization axes of the particles, which comprises the steps of:
- (a) preparing a starting amorphous alloy in the form of a quenched thin ribbon by the melt-spun method, the amorphous alloy having a chemical composition which is an average of the composition of the hard magnetic phase and the composition of the soft magnetic phase weighted relative to the volume ratio of the respective phases in the range from 10:90 to 90:10;
- (b) forming the starting amorphous alloy into the form of a magnet block;
- (c) heating the magnet block at a temperature in the range from 600 to 1000.degree. C.; and
- (d) deforming the magnet block compressively at a temperature in the range from 600 to 1000.degree. C. along a direction, the hard magnetic phase having a chemical composition selected from the group consisting of Nd.sub.2 Fe.sub.14 B, Nd.sub.2 (Fe,Co).sub.14 B, Sm.sub.2 Co.sub.17, Sm.sub.2 (Fe,Co).sub.17, Sm(Fe,M.sup.1).sub.12, Sm(Fe,Co,M.sup.1).sub.12, Sm.sub.2 Fe.sub.17 nitride, Sm.sub.2 (Fe,Co).sub.17 nitride, (Nd,M.sup.2)Fe.sub.x

			nitride and (Nd,M.sup.2)(Fe,Co).sub.x nitride, in which M.sup.1 is an element selected from the group consisting of titanium, vanadium, chromium, molybdenum, silicon and copper and M.sup.2 is an element selected from the group consisting of titanium, vanadium, zirconium, molybdenum, hafnium, tantalum, silicon and aluminum, and the soft magnetic phase being selected from the group consisting of bcc-iron, cobalt, Fe.sub.3 B, Fe.sub.2 B, FeCo alloys, (Fe,Co).sub.3 B, (Fe,Co).sub.2 B, FeM.sup.1 alloys, FeM.sup.1 intermetallic compounds, FeCoM.sup.2 alloys, FeM.sup.2 intermetallic compounds, FeCoM.sup.2 alloys and FeCoM.sup.2 intermetallic compounds, in which M.sup.1 and M.sup.2 each have the same definition as given above and the subscript x is a number in the range from 5 to 12

			$\alpha$ —Fe and Nd <sub>2</sub> Fe <sub>14</sub> B crystal structures, said method comprising the steps of: continuously casting in an inert gas atmosphere at reduced pressures of 30 kPa or less, on a single cooling roller or between a pair of rollers rotating at a specific peripheral speed, an alloy melt having a composition expressed as Fe <sub>100-x-y</sub> B <sub>x</sub> R <sub>y</sub> (R is one or two of Pr, Nd, or Dy) where the symbols x and y satisfy the following values: $15 \le x \le 30$ at % $1 \le y \le 5$ at %.
Filed: November 5, 1996	6,143,193	Assignee: Seiko Epson	Rare earth bonded magnet, rare earth magnetic composition, and method for manufacturing rare earth bonded magnet
3, 1990		Corporation	Abstract
Issued:		Corporation	
Issued: November 7, 2000 Expires: Nov 2016		(JAPAN)	A rare earth bonded magnet comprising a rare earth magnet powder bonded with a binder resin is manufactured by extrusion or injection molding. A rare earth bonded magnet manufactured by extrusion molding has a rare earth magnet powder content of 78.1 to 83.0 percent by volume. A rare earth bonded magnet manufactured by injection molding has a rare earth magnet powder content of 68.0 to 76.0 percent by volume. Preferably, the rare earth metal powder is at least one of SmCo alloys, RFeB alloys wherein R is at least one of rare earth elements including Y, and SmFeN alloys. Preferably, the thermoplastic resin include polyamide, liquid crystal polymer, and Polyphenylene sulfide. Preferably, the rare earth bonded metal has a void ratio of 2 percent by volume or less. A rare earth bonded magnet is manufactured by kneading a rare earth magnetic composition comprising a rare earth magnet powder and a thermoplastic resin, and by extruding or injecting the mixture
			after kneading. A rare earth magnetic composition used for extrusion molding contains a rare earth metal powder of 77.6 to 82.5 percent by volume, and a rare earth magnetic composition used for injection molding contains a rare earth metal powder of 67.6 to 75.5 percent by volume. Preferably, such rare earth magnetic compositions further comprise an antioxidant, such as a

			chelating agent. Thus, a rare earth bonded magnet showing excellent moldability and magnetic properties and high mechanical strength at a minimum binding resin can be obtained.
			What is claimed is:
			1. A rare earth bonded magnet [composition of matter] produced from a rare earth magnetic composition comprising a rare earth magnet powder, a thermoplastic resin and a chelating agent for preventing oxidation of said rare earth magnet powder and said thermoplastic resin by extrusion molding, wherein the content of the rare earth magnet powder in the rare earth bonded magnet ranges from 78.1 to 83 percent by volume and said rare earth bonded magnet has a void ratio of 2 percent by volume or less thereby yielding a high magnetic energy product having excellent fluidity during extrusion molding such that a variety of different shaped and sized magnets may be formed, said rare earth magnet powder selected from the group consisting of:
			a first composition comprising (1) R wherein R is at least one rare earth element including Y, (2) transition metals including Fe as the main ingredient, and (3) B; and
			a second composition comprising rare earth elements containing Sm as the main ingredient, transition metals including Fe as the main ingredient, and interstitial elements containing N as the main ingredient.

			of iron with or without impurities; where the rare earth content is greater than
			50 percent praseodymium with an effective amount of a light rare earth
			selected from the group consisting of cerium, lanthanum, yttrium and mixtures thereof, and balance neodymium.

			What is claimed is:  1. A sintered intermetallic product comprising [composition of matter] compacted and sintered particulate of an iron-boron-rare earth alloy having
			substantially non-interconnecting pores with a density of at least 87 percent of theoretical and where the alloy further comprises about 13 to about 19 atomic percent rare earth, where the rare earth content consists essentially of greater than 50 percent praseodymium, an effective amount of light rare earth selected from the group consisting of cerium, lanthanum, yttrium and mixtures thereof, and balance neodymium; about 4 to about 20 atomic percent boron; and balance iron with or without impurities.
			47. A praseodymium-rich anisotropic permanent magnet of the iron-boron-rare earth alloy comprising <i>[composition of matter]</i> in atomic percent about 13 to about 19 percent rare earth element or elements, about 4 to about 20 percent boron, and about 61 to about 83 percent of iron with or without impurities; where the rare earth content is greater than 50 percent praseodymium with an effective amount of a light rare earth selected from the group consisting of cerium, lanthanum, yttrium and mixtures thereof, and balance neodymium; where the magnet consists essentially of substantially non-interconnecting pores having a density of at least 87 percent theoretical and substantially magnetically aligned grains of RE.sub.2 Fe.sub.14 B tetragonal crystals.
Filed: December	6,078,237	Assignee:	Rare earth-based permanent magnet material and method for the preparation thereof

magnetic properties by virtue of the magnetic coupling between the magnetically hard and soft phases. The magnet material has a structure consisting of crystalline particles of, e.g., Nd.sub.2 Fe.sub.14 B, having a particle diameter of 1 .mu.m or larger and fine crystals of iron of submicron size in a rod-shaped or platelet form precipitated within each crystalline particle of Nd.sub.2 Fe.sub.14 B. This magnet material can be prepared by several different methods including, for example, a solid phase reaction of an intermetallic compound of Nd.sub.2 Fe.sub.17 with boron to effect a double decomposition reaction producing Nd.sub.2 Fe.sub.14 B and iron.

## What is claimed is:

- 1. A rare earth-based permanent magnet material comprising *[composition of matter]*, as the essential ingredients, at least one kind of the rare earth elements R, iron Fe and boron B and having a metallographic structure consisting of a magnetically hard phase of the formula R.sub.2 Fe.sub.14 B and a magnetically soft phase of iron Fe, in which the phase of R.sub.2 Fe.sub.14 B is in the form of crystalline particles having a particle diameter of at least 1  $\mu$ m and the phase of iron is precipitated within the crystalline particles of R.sub.2 Fe.sub.14 B in a rod-shaped form or in the form of a platelet having a dimension not exceeding 200 nm.
- 4. A rare earth-based permanent magnet material *[composition of matter]* comprising, as the essential ingredients, at least one kind of the rare earth elements R, iron Fe, cobalt Co and boron B and having a metallographic structure consisting of a magnetically hard phase of the formula R.sub.2 (Fe,Co).sub.14 B and a magnetically soft phase of an alloy of iron and cobalt, in which the phase of R.sub.2 (Fe,Co).sub.14 B is in the form of crystalline particles having a particle diameter of at least 1  $\mu$ m and the phase of the alloy of iron and cobalt is precipitated within the crystalline particles of R.sub.2 (Fe,Co).sub.14 B in a rod-shaped form or in the form of a platelet having a dimension not exceeding 200 nm.

1997		Hitachi Metals Ltd.	Abstract  A rare couth normalization assentially, by weight, of 27.0
Issued: December 7, 1999  Expires: May 2017		(Tokyo, JAPAN)	A rare earth permanent magnet consisting essentially, by weight, of 27.0-31.0% of at least one rare earth element including Y, 0.5-2.0% of B, 0.02-0.15% of N, 0.25% or less of O, 0.15% or less of C, at least one optional element selected from the group consisting of 0.1-2.0% of Nb, 0.02-2.0% of Al, 0.3-5.0% of Co, 0.01-0.5% of Ga and 0.01-1.0% of Cu, and a balance of Fe, and a production method thereof. The contents of rare earth element, oxygen, carbon and oxygen in the magnet are regulated within the specific ranges.
			What is claimed is:
			1. A method for <i>[process/method]</i> producing a rare earth permanent magnet consisting essentially, by weight, of 27.0-31.0% of at least one rare earth element including Y, 0.5-2.0% of B, 0.02-0.15% of N, 0.25% or less of O, 0.15% or less of C, at least one optional element selected from the group consisting of 0.1-2.0% of Nb, 0.02-2.0% of Al, 0.3-5.0% of Co, 0.01-0.5% of

Ga and 0.01-1.0% of Cu, and a balance of Fe, said method comprising the steps of:

finely pulverizing in a mill a coarse powder of an R-Fe-B-based alloy, wherein said R-Fe-B-based alloy consists essentially, by weight, of 27.0-0-31.0% of at least one rare earth element R including Y,0.5-2.0% of B, at least one optional element selected from the group consisting of 0.1-2.0% of Nb, 0.02-2.0% of Al, 0.3-5.0% of Co, 0.01-0.5% of Ga and 0.01-1.0% of Cu, and a balance of Fe, in a nitrogen gas atmosphere having an oxygen content of substantially zero or in an argon gas atmosphere having an oxygen content of substantially zero and containing 0.0001-0.1 volume % of nitrogen, under a pressure of 5-10 kgf/cm.sup.2 while feeding said coarse powder into said mill at a feeding rate of 3-20 kg/hr;

recovering the fine powder into a solvent in a nitrogen gas atmosphere or an argon gas atmosphere in the form of a slurry;

wet-compacting said slurry to form a green body while applying a magnetic field;

heat-treating said green body in a vacuum furnace to remove said solvent therefrom; and

sintering said heat-treated green body in said vacuum furnace.

2. The method *[process/method]* according to claim 1 wherein said coarse powder is obtained by

strip-casting a melt of said R-Fe-B-based alloy into an alloy strip having 1 mm or less;

			heat-treating said alloy strip at 800-1100.degree. C. in an inert gas atmosphere or in vacuo; and
			coarsely pulverizing said heat-treated alloy strip

1998		Showa Denko K.K.	Abstract
		(T. 1	The magnetic properties of rare earth magnet are improved by means of
Issued: October 5, 1999 Expires: April 2018		(Tokyo, JAPAN)	forming a novel structure of the cast alloy used for the production of a rare earth magnet, which contains from 27 to 34% by weight of at least one rare earth element (R) including yttrium, from 0.7 to 1.4% by weight of boron, and the balance being essentially iron and, occasionally any other transition element, and comprises an R.sub.2 T.sub.14 B phase, an R-rich phase and optionally at least one ternary phase except for the R.sub.2 T.sub.14 B phase and the R-rich phase. The novel structure is that the volume fraction (V) in percentage of said R.sub.2 T.sub.14 B phase and said at least one ternary phase is more than 138-1.6r (with the proviso that r is the content of R), the average grain size of the R.sub.2 T.sub.14 B phases is from 10 to 100 .mu.m and, further, the average spacing between the adjacent R-rich phases is from 3 to 15 .mu.m. The novel structure can be formed by by means of feeding alloy melt onto a rotary casting roll, cooling in a temperature range of from melting point to 1000.degree. C. at a cooling rate of 300.degree. C. per second or more, and further cooling in a temperature range of from 800 to 600.degree. C. at a cooling rate of 1.degree. C./second or less.
			We claim:
			1. A method of producing <i>[process/method]</i> a cast alloy, comprising:
			feeding a melt onto a rotary casting roll, the melt comprising from 27 to 34% by weight of at least one element selected from the group consisting of the rare

earth elements (R) and yttrium, from 0.7 to 1.4% by weight of boron, with the balance being essentially iron, and optionally other transition elements; cooling the melt in a temperature range of from melting point to 1000.degree. C. at a cooling rate of 300.degree. C. per second or more; and

further cooling in a temperature range of from 800.degree. C. to 600.degree. C. at a cooling rate of 0.80.degree. C./second or less.

- 2. A method *[process/method]* according to claim 1, wherein the cooling rate in the temperature range of from melting point to 1000.degree. C. is 500.degree. C. per second or more, and, further the cooling rate in the temperature range of from 800.degree. C. to 600.degree. C. is 0.75.degree. C. per second or less.
- 3. A method for producing a magnet, comprising:

crushing and pulyerizing a cast alloy into powder;

compacting the powder under a magnetic field; and

sintering the compacted power,

wherein the cast alloy is obtained by:

feeding a melt onto a rotary casting roll, the melt comprising from 27 to 34% by weight of at least one element selected from the group consisting of the rare earth elements (R) and yttrium, from 0.7 to 1.4% by weight of boron, with the balance being essentially iron, and optionally other transition elements;

cooling the melt in a temperature range of from melting point to 1000.degree. C. at a cooling rate of 300.degree. C. per second or more; and

			further cooling in a temperature range of from 800.degree. C. to 600.degree. C. at a cooling rate of 0.80.degree. C./second or less.
Filed: June 3,	5,942,053	Assignee:	Composition for permanent magnet
1998		Sanei Kasei Co., Ltd.	Abstract The chiest of the invention is to provide a composition for power and magnet
Issued: August 24, 1999 Expires: June 2018		(Tokyo, JAPAN)	The object of the invention is to provide a composition for permanent magnet with excellent magnetic properties exhibiting well the latent ability of the RFeB system tetragonal compounds. The composition for permanent magnet according to the present invention is a complex of (1) a crystalline RFeB or RFeCoB system compound having a tetragonal crystal structure with lattice constants of a.sub.o about 8.8 .ANG. and c.sub.o about 12 .ANG., in which R is at least one of rare earth elements, and (2) a crystalline neodymium oxide having a cubic crystal structure, in which both crystal grains are epitaxially connected and the RFeB or RFeCoB crystal grains are oriented to the c.sub.o direction. The lattice constant a.sub.o of the cubic Nd.sub.2 O.sub.3 is about 4.4 .ANG. which is the half length of the lattice constant a.sub.o about 8.8 .ANG. for the RFeB or RFeCoB tetragonal crystal, and the epitaxial connection is achieved, and the RFeB or RFeCoB crystal grains are oriented to the c.sub.o direction.
			What is claimed is:
			1. A permanent magnet comprising [composition of matter] a complex of:
			(1) a crystalline RFeB or RFeCoB compound having a tetragonal crystal structure with lattice constants of a.sub.o about 8.8 .ANG. and c.sub.o about 12 .ANG., in which R is at least one of rare earth elements, and
			(2) a crystalline neodymium oxide having a cubic crystal structure, wherein

both crystal grains of (1) and (2) are epitaxially connected and the RFeB or RFeCoB crystal grains are oriented to the c.sub.o direction.

- 5. A method for *[process/method]* preparing a permanent magnet comprising a complex of
- (1) a crystalline RFeB or RFeCoB compound having a tetragonal crystal structure with lattice constants of a.sub.o about 8.8 .ANG. and c.sub.o about 12 .ANG., in which R is at least one of rare earth elements, and
- (2) a crystalline neodymium oxide having a cubic crystal structure, wherein both crystal grains of (1) and (2) are epitaxially connected and the RFeB or RFeCoB crystal grains are oriented to the c.sub.o direction, comprising the following steps:

mixing precursor, selected from the group consisting of RFeB powder and RFeCoB powder, with Zn powder in an organic solvent;

crushing the mixed powders in the solvent under an inert gas atmosphere containing up to 1 volume percent oxygen, said Zn acting as a catalyst to oxidize R to form R-oxide cubic crystals of R.sub.2 O.sub.3 and RO.sub.x, x=1, 1.5 or 2, in epitaxial connection with the tetragonal crystals of RFeB or RFeCoB;

drying the crushed powders in an inert gas;

compacting the dried powders under a magnetic field; and

sintering the compacted powder and evaporating the Zn under pressure in an inert gas.

Dec 2017			2-10 at % of M, and having a hard magnetic phase (TbCu.sub.7 type
			crystalline phase) and a soft magnetic phase (which is a bcc structured T phase,
			has an average grain diameter of 5-60 nm, and accounts for 10 to 60% by
			volume of the entirety), the atomic ratio (R+M)/(R+T+M) in the hard magnetic
			phase being in excess of 12.5%, is prepared utilizing a single roll technique. In the single roll technique, the peripheral speed of a chill roll is at least 50 m/s,
			and the discharge pressure of the molten alloy is 0.3-2 kgf/cm.sup.2. Following
			quenching, the quenched alloy is subjected to heat treatment at 600-
			800.degree. C. and then to nitriding treatment.
			We claim:
			1. A method <i>[process/method]</i> for preparing a magnet containing R, T, nitrogen, and M, wherein
			introgen, and wi, wherein
			R is at least one rare earth element, wherein R contains at least 50 at % of
			samarium,
			T is iron or iron and cobalt, and
			M is zirconium with or without partial replacement by at least one element
			selected from the group consisting of Ti, V, Cr, Nb, Hf, Ta, Mo, W, Al, C, and

Ρ,

wherein said magnet consists essentially of 4 to 8 at % of R, 10 to 20 at % of nitrogen, 2 to 10 at % of M, and the balance of T, and has a hard magnetic phase and a soft magnetic phase,

wherein the hard magnetic phase is based on R, T, and nitrogen and has a TbCu.sub.7 crystal structure,

wherein the soft magnetic phase consists of a phase of T having bcc structure, the soft magnetic phase has an average grain diameter of 5 to 60 nm, the content of the soft magnetic phase is 10 to 60% by volume, and

wherein the atomic ratio (R+M)/(R+T+M) in the hard magnetic phase is in excess of 0.125,

said method comprising:

quenching a melt containing R, T and M by a single roll technique of injecting a molten alloy from a nozzle against the peripheral surface of a chill roll to obtain a quenched molten alloy in the form of a thin ribbon containing a crystalline phase having a TbCu.sub.7 crystal structure and an amorphous phase,

heat treating the quenched alloy in vacuum or in an inert gas atmosphere, and

nitriding the heat treated and quenched alloy,

wherein the peripheral speed of the chill roll in said quenching step is at least 50 m/s, the discharge pressure of the molten alloy in said quenching step is 0.3 to 2 kgf/cm.sup.2, and the treating temperature in said heat treatment step is

			600 to 800.degree. C.
Filed: April 10, 1997	5,908,513	Assignee: Showa Denko K.K.	Cast alloy used for production of rare earth magnet and method for producing cast alloy and magnet
1997		Showa Deliko K.K.	Abstract
Issued: June 1, 1999  Expires:		(Tokyo, JAPAN)	The magnetic properties of rare earth magnet are improved by means of forming a novel structure of the cast alloy used for the production of a rare earth magnet, which contains from 27 to 34% by weight of at least one rare earth element (R) including yttrium, from 07 to 1.4% by weight of boron, and the balance being essentially iron and, occasionally any other transition element, and comprises an R.sub.2 T.sub.14 B phase, an R-rich phase and
April 2017			optionally at least one ternary phase except for the R.sub.2 T.sub.14 B phase and the R-rich phase. The novel structure is that the volume fraction (V) in percentage of said R.sub.2 T.sub.14 B phase and said at least one ternary phase is more than 138-1.6r (with the proviso that r is the content of R), the average grain size of the R.sub.2 T.sub.14 B phases is from 10 to 100 .mu.m and, further, the average spacing between the adjacent R-rich phases is from 3 to 15 .mu.m. The novel structure can be formed by by means of feeding alloy melt onto a rotary casting roll, cooling in a temperature range of from melting point to 1000.degree. C. at a cooling rate of 300.degree. C. per second or more, and further cooling in a temperature range of from 800 to 600.degree. C. at a cooling rate of 1.degree. C./second or less.
			We claim:
			1. A cast alloy used for the production of a rare earth magnet, which <i>[composition of matter]</i> :
			(a) contains from 27 to 34% by weight of at least one member selected from yttrium and rare earth elements, from 0.7 to 1.4% by weight of boron, and the

			balance being essentially iron and, optionally any other transition element, and
			(b) a R.sub.2 T.sub.14 B phase, an R-rich phase and optionally at least one ternary phase other than the R.sub.2 T.sub.14 B phase and the R-rich phase,
			characterized in that the volume fraction (V), in percent, of said R.sub.2 T.sub.14 B phase and said at least one ternary phase is more than 138-1.6r, with the proviso that r is the content of R, the average grain size of the R.sub.2 T.sub.14 B phases is from 10 to 100 .mu.m is greater than the average spacing between the adjacent R-rich phases in a range from 3 to 15 .mu.m.
			2. A cast alloy used for the production of a rare earth magnet according to claim 1, which contains <i>[composition of matter]</i> from 28 to 33% by weight of at least one rare earth element (R) including yttrium, from 0.95 to 1.1% by weight of boron, and the balance being essentially iron and, occasionally any other transition element, characterized in that the volume fraction (V') in percent of said R.sub.2 T.sub.14 B phase is in the range of from 138-1.6r <v'<95, .mu.m="" .mu.m.<="" 10="" 3="" 50="" adjacent="" and,="" average="" b="" between="" from="" further,="" grain="" is="" of="" phases="" r-rich="" r.sub.2="" size="" spacing="" t.sub.14="" td="" the="" to=""></v'<95,>

Aug 2017			than 10 kG, an intrinsic coercive force (iHc) as large as not less than 3.5 kOe

and a large maximum energy product ((BH)max) and which has an excellent rust preventability

What is claimed is:

1. A rare earth bonded magnet having a maximum energy product ((BH)max) of not less than 11 MGOe, comprising *[composition of matter]*:

a magnet powder (A) represented by the following formula (1), which comprises Nd.sub.2 Fe.sub.14 B.sub.1 type crystals, which has an intrinsic coercive force (iHc) of not less than 7 kOe and which has an average particle diameter of not less than 100 .mu.m:

wherein M.sup.1 is at least one element selected from the group consisting of Ti, V, Cr, Zr, Nb, Mo, Hf, Ta, W, Mn, Cu and Ni, R is a least one element selected from the group consisting of Nd, Pr, Dy, Tb and Ce, a is 8 to 11, b is 0.1 to 10, c is 2 to 10 and d is 0 to 0.2;

a magnetic powder (B) represented by the following formula (2), which has an average particle diameter of not more than 50 .mu.m:

wherein M.sup.2 is at least one element selected from the group consisting of Ti, V, Cr, Zr, Nb, Mo, Hf, Ta, W, Mn, Cu, Ga, Zn, In, Sn, Bi, Ag and Si, R is one element selected from the group consisting of Nd, Pr, Dy, Tb and Ce, x is 5 to 10, y is 1 to 9, z is 0.1 to 5, w is 2 to 7, and x+w is not less than 9;

and a binder resin,

said rare earth bonded magnet being produced by compounding magnet powder (A), magnet powder (B) and binder resin, and molding the obtained mixture.

			20. A process <i>[process/method]</i> for producing a rare earth-iron-boron type magnet alloy as defined in claim 15, comprising the steps of: producing a mixture having a composition represented by the following formula (5):  R.sub.x Fe.sub.(100-w-x-y-z) Co.sub.y M.sup.3.sub.z B.sub.w(5)  wherein R is one element selected from the group consisting of Nd, Pr, Dy, Tb and Ce, M.sup.4 is at least one element selected from the group consisting of Ti, V, Cr, Zr, Nb, Mo, Hf, Ta, W, Mn, Cu, Ga, Ag and Si, x is 5 to 10, y is 1.0 to 9.0, z is 0.1 to 5, w is 2 to 7, (x+w) is not less than 9 and (y+z) is not less than 5; melting said obtained mixture under heating to produce a molten alloy; quenching and solidifying said molten alloy; and heat-treating the quenched and solidified alloy in the temperature range of 600

2010			What is claimed is.
			1. A high-resistance rare earth magnet [composition of matter] comprising
			an RFeB-based magnet phase wherein R is at least one rare earth element
			including Y and a compound phase comprising at least one compound selected
			from the group consisting of fluorides of Li, Na, Mg, Ca, Ba and Sr, said R

			FeB-based magnet phase being dispersed throughout said compound phase.
			2. The high-resistance rare earth magnet according to claim 1, wherein said R-Fe-B-based magnet comprises 10-40 weight % of R, 0.5-5 weight % of B and the balance of Fe, each percentage being based on a total amount of said R-Fe-B-based magnet.
			8. A process <i>[process/method]</i> for producing a high-resistance rare earth magnet according to claim 1, comprising the steps of:
			mixing an RFeB-based magnet powder wherein R is at least one rare earth element including Y, with at least one powder selected from the group consisting of powders of fluorides of Li, Na, Mg, Ca, Ba and Sr;
			compacting the resultant powder mixture to form a green body; and
			subjecting said green body to a sintering.
Filed: November 29, 1995	5,803,992	Assignee: Iowa State University Research Foundation,	Carbide/nitride grain refined rare earth-iron-boron permanent magnet and method of making
		Inc.	Abstract
Issued:		(A TA TIGA )	A method of making a permanent magnet wherein 1) a melt is formed having a
September 8, 1998		(Ames, IA USA)	base alloy composition comprising RE, Fe and/or Co, and B (where RE is one or more rare earth elements) and 2) TR (where TR is a transition metal selected
Expires:			from at least one of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, W, and Al) and at least one of C and N are provided in the base alloy composition melt in substantially
Nov 2015			stoichiometric amounts to form a thermodynamically stable compound (e.g. TR carbide, nitride or carbonitride). The melt is rapidly solidified in a manner
			to form particulates having a substantially amorphous (metallic glass) structure and a dispersion of primary TRC, TRN and/or TRC/N precipitates. The

			amorphous particulates are heated above the crystallization temperature of the base alloy composition to nucleate and grow a hard magnetic phase to an optimum grain size and to form secondary TRC, TRN and/or TRC/N precipitates dispersed at grain boundaries. The crystallized particulates are consolidated at an elevated temperature to form a shape. During elevated temperature consolidation, the primary and secondary precipitates act to pin the grain boundaries and minimize deleterious grain growth that is harmful to magnetic properties.
			The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:
			1. Rapidly solidified particulates <i>[composition of matter]</i> comprising RE, at least one of Fe and Co, and B, where RE is one or more rare earth elements, in proportions for forming a hard magnetic phase, said particulates having an amorphous or microcrystalline structure and having precipitates comprising at least one of a carbide, nitride and carbonitride of a transition metal dispersed throughout the structure.
			2. The particulates of claim 1 which have been heat treated to have a hard magnetic phase microstructure and precipitates comprising at least one of a carbide, nitride and carbonitride of a transition metal dispersed throughout the microstructure.

Issued:		(IADAN)	in magnetic anisotropy, and an RFeBCo based alloy magnetic powder
July 1, 1997		(JAPAN)	excellent in magnetic anisotropy and temperature characteristic an RFeB based alloy is subjected to hydrogenation under pressurized hydrogen gas and to dehydrogenation. Excellent magnetic properties and stable with less

Expires: Aug 2014	variation in range can be attained in an industrial fabrication by using a plurality of divided reaction tubes. Moreover, the RFeBCo based alloy
	magnetic powder is constituted of an aggregate structure including, as a main phase, a recrystallized structure of an extremely fine R.sub.2 Fe.sub.14 B type phase with an average grain size of 0.05 to 3 .mu.m, and has excellent magnetic anisotropy and temperature characteristic. Additionally, a resin bonded magnet excellent in magnetic properties and temperature characteristic is fabricated by injection molding or compression molding using the above R-Fe-BCo based alloy magnetic powder.
	What is claimed is:
	1. A method of fabricating <i>[process/method]</i> a rare earth-iron-boron based alloy magnetic powder excellent in magnetic anisotropy comprising the steps of:
	homogenizing an ingot of an alloy mainly containing R, Fe and B at a temperature ranging from 800.degree. to 1200.degree. C. in an inert gas atmosphere, wherein R represents a rare earth element including Y;
	crushing said homogenized ingot into fragments;
	subjecting said fragments to hydrogenation while holding said fragments in a hydrogen gas atmosphere pressurized to a hydrogen gas pressure of from about 1.2 to 1.6 kgf/cm.sup.2 at a temperature ranging from 750.degree. to 950.degree. C.;
	subjecting said hydrogenated fragments to dehydrogenation while holding said hydrogenated fragments at a temperature ranging from 500.degree. to

800.degree. C. in a vacuum atmosphere until the pressure of the hydrogen gas

			rapidly cooling said dehydrogenated fragments.  9. A rare earth-iron-boron-cobalt based resin bonded magnet excellent in magnetic anisotropy and temperature characteristic, wherein said resin bonded magnet is formed by [process/method] molding a mixture of a resin binder and said RFeBCo based alloy magnetic powder fabricated by the method claimed in claim 8 or said NdFeBCo based alloy magnetic powder fabricated by the method claimed in claim 8 by way of an injection molding process.
Filed: August 28, 1995  Issued: May 6, 1997  Expires: Aug 2015	5,626,690	Assignee:  Kawasaki Steel Corporation  (JAPAN)	Low boron amorphous alloy having excellent soft magnetic characteristics  Abstract A low boron amorphous alloy having excellent soft magnetic characteristics, composed of B: about 6-10 at %, Si: about 10-17 at %, P: about 0.02-2 at % and the balance Fe and incidental impurities. The invention lowers production costs because the content of expensive boron is reduced.  What is claimed is:  1. A low boron amorphous alloy having excellent soft magnetic characteristics, consisting of <i>[composition of matter]</i> :  about 6-10 at % B;  about 10-17 at % Si;  about 0.02-2 at % P; and  the balance Fe and incidental impurities.

			master alloy both in powder form and sintering the compact. The primary
Expires:			phase-forming master alloy has columnar crystal grains of R.sub.2 T.sub.14 B
Nov 2014			with a mean grain size of 3-50 .mu.m and grain boundaries of an R rich phase and contains 26-32 wt % of R. The grain boundary phase-forming master alloy
			is a crystalline alloy consisting essentially of 32-60 wt % of R and the balance
			of Co or Co and Fe. In anther form, a permanent magnet which contains R, T
			and B as main ingredients wherein R is yttrium or a rare earth element, T is Fe
			or Fe+Co/Ni and has a primary phase of R.sub.2 T.sub.14 B is produced by
			compacting a mixture of a primary phase-forming master alloy and a grain
			boundary-forming master alloy both in powder form and sintering the compact.

The primary phase-forming master alloy has a primary phase of R.sub.2 T.sub.14 B and grain boundaries of an R rich phase. The grain boundary-forming master alloy contains 40-65 wt % of R, 30-60 wt % of Fe, Co or Ni and 1-12 wt % of Sn, In or Ga.

## We claim:

1. A method for *[process/method]* preparing a permanent magnet which contains R, T and B as main ingredients wherein R is at least one element selected from yttrium or rare earth elements, T is iron or a mixture of iron and cobalt, and B is boron and has a primary phase consisting essentially of R.sub.2 T.sub.14 B,

said method comprising the steps of compacting to obtain a compact a mixture of a primary phase-forming master alloy and a grain boundary phase-forming master alloy both in powder form and sintering the compact, wherein

said primary phase-forming master alloy contains 90 to 100% by volume columnar crystal grains consisting essentially of R.sub.2 T.sub.14 B and having a mean grain size of 3 to 50 .mu.m produced by cooling an alloy melt from one direction or two directions., and grain boundaries composed primarily of an R rich phase having an R content higher than R.sub.2 T.sub.14 B, said primary phase-forming master alloy consisting essentially of 26 to 32% by weight of R, 0.9 to 2% by weight of B, and the balance of T,

said grain boundary phase-forming master alloy is a crystalline alloy consisting essentially of 32 to 60% by weight of R and the balance of cobalt or a mixture of cobalt and iron, and

said mixture contains 60 to 95% by weight of said primary phase-forming master alloy.

April 2014			stoichiometric amounts to form a thermodynamically stable compound (e.g.
7 ipin 201 i			TR carbide, nitride or carbonitride). The melt is rapidly solidified in a manner
			to form particulates having a substantially amorphous (metallic glass) structure
			and a dispersion of primary TRC, TRN and/or TRC/N precipitates. The
			amorphous particulates are heated above the crystallization temperature of the
			base alloy composition to nucleate and grow a hard magnetic phase to an
			optimum grain size and to form secondary TRC, TRN and/or TRC/N
			precipitates dispersed at grain boundaries. The crystallized particulates are
			consolidated at an elevated temperature to form a shape. During elevated
			temperature consolidation, the primary and secondary precipitates act to pin
			the grain boundaries and minimize deleterious grain growth that is harmful to
			magnetic properties.
			magnetic properties.
			The embodiments of the invention in which an exclusive property or privilege
			is claimed are defined as follows:
			1. A method of making <i>[process/method]</i> a permanent magnet having a base
			alloy composition comprising RE, at least one of Fe and Co, and B wherein RE
			is one or more rare earth elements, comprising:
			a) forming a melt having said base alloy composition in which TR, where TR

			is a transition metal selected from the group consisting of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, W, and Al and at least one of C and N are provided as additives to form upon melt solidification a compound that is more thermodynamically stable than a compound otherwise formable between the additives and the base alloy components, whereby the base alloy components are not involved in formation of said compound,
			b) rapidly solidifying the melt in a manner to form particulates having at least one of a substantially amorphous structure and micro-crystalline structure, including forming primary precipitates comprising said compound by reaction of said TR and said at least one of said C and N, said precipitates being dispersed in said structure,
			c) heating the solidified particulates above the crystallization temperature of the base alloy composition to improve a magnetic property of said structure, including forming secondary precipitates comprising said compound at grain boundaries by reaction of said TR and said at least one of said C and N, and
			d) consolidating the particulates at an elevated temperature, said precipitates resisting grain growth in said structure at said elevated temperature.
			2. The method of claim 1 wherein the TR and C additives are introduced in elemental form to the melt having the base alloy composition.

produced, the specific composition of Fe--Co--B--R (Pr, Nd)--M(Ag, Al, Si, Ga, Cu, Au) type molten alloy was rapidly solidified by the melt-quenching or atomization methods, or a combination of the two methods to obtain more than 90% of the solid in an essentially amorphous structure. After the temperature was raised at the rate of 1.degree..about.15.degree. C./min., the alloy was heat treated at 550.degree..about.730.degree. C. for 5 minutes.about.6 hours to obtain Fe-rich the boron compound phase, which crystallizes the body centered tetragonal Fe.sub.3 P type crystalline structure, and the Nd.sub.2 Fe.sub.14 B type crystalline structure phase both coexisting as fine crystalline clusters of the average crystalline diameter of 5 nm.about.100 nm. The alloy powder which contains the ferromagnetic phase, where the boron compound phase and the Nd.sub.2 Fe.sub.14 B type phase coexist, is combined with resin to produce the high performance resin bonded magnet with iHc.gtoreq.3 kOe, Br.gtoreq.5 kG, and (BH)max.gtoreq.3 MGO

## What is claimed is:

1. A rare earth magnet having a compositional formula *[composition of matter]* of

Fe.sub.100-x-y-z Co.sub.x B.sub.y R.sub.z M.sub.w

wherein R is at least one of Pr and Nd, M is one or two of Al, Si, Cu, Ga, Ag, and Au, symbols x, y, z and w each indicating a limit of composition range and respectively falling within the ranges of 0.05.ltoreq.x.ltoreq.15 at. %,  $16 \le y \le 22$  at. %,  $3 \le z \le 6$  at. %, and 0.1.ltoreq.w.ltoreq.3 at. %, said rare earth magnet including an iron-rich boron compound phase having a body-centered tetragonal Fe.sub.3 B crystalline structure and a phase of Nd.sub.2 Fe.sub.14 B crystalline structure and said rare earth magnet comprising a crystallite aggregate having an average crystalline particle diameter of 5 nm to 100 nm, said crystallite aggregate having been formed by rapidly solidifying a molten alloy by a melt quenching or gas atomizing method to cause substantially more

			than 90% of the solidified alloy to be amorphous, and heat-treating the rapidly solidifying alloy by raising its temperature from 500 C./min and maintaining a temperature of from 550 C. for a period of from5 minutes to 360 minutes, the rare earth magnet of which displays magnetic properties of iHc≥3 kOe, Br≥9 kG and (BH) max≥10 MGOe.
Filed: June 24,	<u>5,538,565</u>	Assignee:	Rare earth cast alloy permanent magnets and methods of preparation
1993		Seiko Epson	Abstract
Issued:		Corporation	A rare earth iron permanent magnet including at least one rare earth element, iron and boron as primary ingredients. The magnet can have an average grain
July 23, 1996		(Tokyo, JAPAN)	diameter of less than or equal to about 150 .mu.m and a carbon content of less than or equal to about 400 ppm and an oxygen content of less than or equal to about 1000 ppm. The permanent magnet is prepared by casting a molten alloy.
Expires: June 2013			In one embodiment, the cast body is heat treated at a temperature of greater than or equal to about 250.degree. C. Alternatively, the material can be cast and hot worked at a temperature of greater than or equal to about 500.degree. C. Finally, the material can be cast, hot worked at a temperature of greater than or equal to about 500.degree. C. and then heat treated at a temperature of greater than or equal to about 250.degree. C. The magnets provided in accordance with the invention are relatively inexpensive to produce an have excellent performance characteristics.
			We claim:
			1. A method of forming <i>[process/method]</i> a rare earth-iron permanent magnet, comprising:
			melting a rare earth alloy composition including between about 8 and 30 atomic percent of at least one rare earth element, between about 2 and 28 atomic percent boron and iron;

			casting the melted alloy composition to obtain a cast alloy ingot;  hot working the cast alloy ingot at a temperature greater than about 500.degree.  C. in order to make the ingot magnetically anisotropic.  8. The method of claim 3, wherein the alloy includes an effective amount of at least one member selected from the group consisting of Al, Co, Mo, W, Nb, Ta, Zr, Ha, Ti and mixtures thereof for enhancing the coercive force of the magnet.
Filed: Nov 5, 1993 Issued: May 7, 1996 Expires: Nov 2013	5,514,224	Assignee:  Magnequench International, Inc.  (Anderson, IN USA)	Abstract Isotropic hot pressed iron-rare earth metal permanent magnets are provided wherein the hot pressed permanent magnet exhibits magnetic remanences of at least about 9 kG, and most typically about 10 kG. Preferred compositions include a relatively low rare earth content coupled with an optimal amount of boron. The preferred composition is, on a weight percent basis, from about 5_to about 25 percent rare earth, most preferably about 10 to about 20 percent rare earth, from about 0.5 to about 4.5 percent boron, most preferably from about 0.8 to about 4.0 percent boron, wherein the total combination of the rare earths and boron ranges from about 9 percent to about 26 percent, most preferably from about 12 percent to about 22 percent, and optionally from about 2 percent to about 16 percent cobalt, with the balance being essentially iron.  The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:  1. A method for forming [process/method] a hot pressed iron-rare earth-boron permanent magnet, the method comprising the step of;

			providing a quality of isotropic iron-rare earth-boron metal particles having a grain size of not more than about 500 nanometers, wherein said quality of isotropic iron-rare earth-boron metal particles are formed from a composition comprising, on a weight percent basis, from about 10 to about 20 percent rare earth metal, from about 0.8 to about 4.0 percent boron, and wherein the total of said rare earth metal and said boron ranges from about 12 to about 22 percent, with the balance being principally iron; and
			hot pressing said quality of isotropic iron-rare earth-boron metal particles at a temperature of about 750.degree. C. to about 800.degree. C. and for a duration sufficient to form a hot pressed isotropic iron-rare earth-boron metal permanent magnet characterized by the uniform presence of both the hard magnetic phase Nd.sub.2 Fe.sub.14 B and the soft magnetic phases Fe.sub.3 B and .alphaFe, and a magnetic remanence of at least about 9 kiloGauss.
			2. A method for forming a hot pressed iron-rare earth-boron permanent magnet as recited in claim 1 wherein the majority of said rare earth metal is neodymium.
			3. A method for forming a hot pressed iron-rare earth-boron permanent magnet as recited in claim 1 further comprising from about 2 to about 16 percent cobalt.

the permanent magnet material; each of the first and second bodies also comprising a pattern of at least one affected volume in a surface of the body, wherein each affected volume has a magnetic flux density that varies from the substantially uniform predetermined flux density and wherein the first and second bodies are stacked and fixedly attached so that the pattern on each body aligns with the pattern on the other body, wherein at least one affected volume on the first body is aligned with at least one affected volume on the second body and wherein the aligned affected volumes comprise a pole detectable by a magnetic sensor.

## We claim:

- 1. A method for *[process/method]* forming an article with a magnetic pattern thereon, comprising the steps of:
- (a) directing energy in a pattern onto a first base of permanent magnet material having a first volume to heat a plurality of at least two second volumes of the first base of permanent magnet material to a threshold temperature to lower a coercivity thereof, the first base of permanent magnet material having a permanent magnetic field flux density value in a range from zero flux to a flux density of 100% saturation of the base permanent magnet material;
- (b) imposing a magnetic field on the heated second volumes greater than the coercivity of the heated second volumes, wherein the second volumes are treated and the first volume remains untreated, wherein the treated second volumes comprise a treated pattern on the untreated first volume that generates a flux density lower or higher than that of the untreated first volume of the first base of permanent magnet material;
- (c) and allowing the heated second volumes to cool in the imposed field, wherein the treated pattern has a magnetic characteristic sufficiently different

			from the first volume of the first base of permanent magnet material that the treated pattern comprises at least two poles that are readily detected by a magnetic sensor;
			(d) repeating steps (a), (b) and (c) on a second base of permanent magnet material; and
			<ul> <li>(e) stacking and attaching the two bases of permanent magnet material so that the treated pattern of the first base of permanent magnet material aligns with the treated pattern of the second base of permanent magnet material, wherein the at least two poles of the first base of permanent magnet material align and act together with the at least two poles of the second base of permanent magnet material, wherein the detectability of said two poles of said treated pattern of the first base of permanent magnet material by said magnetic sensor is increased without decreasing a spatial density of said two poles of said treated pattern of the first base of permanent magnet material.</li> <li>2. The method of claim 1, also comprising the step of (f) repeating steps (d) and (e) for additional bases of permanent magnet material to form an article comprising a stack of three or more bases of permanent magnet material.</li> </ul>

Expired:			the powder blend is shaped in a magnetic field into a green body which is sintered. In the invention, the first magnetic alloy has a composition of the
Sept 2013			formula R.sub.2 T.sub.14 B, in which R is a rare earth element selected from
l are a sec			the group consisting of neodymium, praseodymium, dysprosium and terbium
			and T is iron or a combination of iron and cobalt, while the second alloy has a
			composition of the formula R.sub.a Fe.sub.b Co.sub.c B.sub.d M.sub.e, in
			which R has the same meaning as defined above, M is an element selected
			from the group consisting of gallium, aluminum, copper, zinc, indium, silicon,
			phosphorus, sulfur, titanium, vanadium, chromium, manganese, germanium, zirconium, niobium, molybdenum, palladium, silver, cadmium, tin, antimony,
			hafnium, tantalum and tungsten, the subscript a is a positive number in the
			range from 15 to 40, b is zero or a positive number not exceeding 80, c is a
-			positive number in the range from 5 to 85, d is a positive number not

exceeding 20 and e is zero or a positive number not exceeding 20 with the proviso that a+b+c+d+e is 100, and the powders are blended in a weight proportion of 99:1 to 70:30.

What is claimed is:

- 1. A method for the preparation *[process/method]* of a rare earth-based permanent magnet which comprises the steps of:
- (a1) melting together, at a temperature of 1000.degree. C. or higher in an inert atmosphere, a rare earth metal, metallic iron or a combination of metallic iron and metallic cobalt and elementary boron in such a proportion represented by the formula

in which R is a rare earth element and T is iron or a combination of iron and cobalt in such a proportion that the amount of cobalt does not exceed 40% by weight of the total amount of iron and cobalt to form a melt of a first magnetic alloy;

- (b1) cooling the melt of the first magnetic alloy in a casting mold at a rate of temperature decrease not exceeding 850.degree. C. per minute but not lower than 1.degree. C. per minute at least until the temperature of the melt reaches 200.degree. C. to form an ingot of the first magnetic alloy;
- (a2) melting together, at a temperature of 1000.degree. C. or higher in an inert atmosphere, a rare earth element, iron and cobalt, elementary boron and the elementary form of an element M defined below in such a proportion represented by the formula

in which R has the same meaning as defined above, M is an element selected from the group consisting of gallium, aluminum, copper, zinc, indium, silicon,

phosphorus, sulfur, titanium, vanadium, chromium, manganese, germanium, zirconium, niobium, molybdenum, palladium, silver, cadmium, tin, antimony, hafnium, tantalum and tungsten, the subscript a is a positive number in the range from 15 to 40, b is zero or a positive number not exceeding 80, c is a positive number in the range from 5 to 85, d is a positive number not exceeding 20 and e is zero or a positive number not exceeding 20 with the proviso that a+b+c+d+e is 100 to form a melt of a second magnetic alloy;

- (b2) cooling the melt of the second magnetic alloy in a casting mold at a rate of temperature decrease not exceeding 850.degree. C. per minute at least until the temperature of the melt reaches 200.degree. C. to form an ingot of the second magnetic alloy;
- (c) crushing and pulverizing the ingots of the first and second magnetic alloys either together or separately in an inert atmosphere into particles having an average particle diameter in the range from 1 to 20 .mu.m;
- (d) uniformly mixing the particles of the first and second magnetic alloys in a weight proportion in the range from 99:1 to 70:30 in an inert atmosphere to form a powder mixture;
- (e) shaping the powder mixture into a powder compact having a form of a magnet by compression molding in a magnetic field;
- (f) sintering the shaped form of the powder compact by heating in vacuum or in an atmosphere of an inert gas at a temperature in the range from 900.degree. C. to 1250.degree. C. for a length of time in the range from 30 minutes to 10 hours; and
- (g) subjecting the <u>sintered</u> body to an aging treatment at a temperature not exceeding 900.degree. C. for at least 30 minutes.

Filed: Oct 19,	5,403,408	Assignee:	Non-uniaxial permanent magnet material
1992		Inland Steel Company	Abstract
Issued: April 4, 1995 Expires: Oct 2012		(Chicago, IL USA)	A permanent magnet material having the formula, in atomic %: wherein - 3.3.ltoreq.z<3.3 and -2.0.ltoreq.w<2.0; or wherein -2.5.ltoreq.y<2.5 and - 2.7.ltoreq.x.ltoreq.2.7; or wherein -1.5.ltoreq.r.ltoreq.1.5 and 0.ltoreq.q<6.5-r; and wherein TM is a transition metal, RE is a rare earth metal, and B is boron or a combination of boron and carbon. The permanent magnet materials include at least weight percent non-uniaxial material and possess a coactivity of at least 1,000 Oersteds.
			We claim:
			1. A permanent magnet material comprising <i>[composition of matter]</i> a transition metal, a rare earth metal and a boron component, said magnet material including at least 10 weight percent of a material having more than one easy axis of magnetization and having a coercivity of at least about 1,000 Oersteds, said magnet material having the formula, in atomic %:
			wherein -3.3.ltoreq.z<3.3 and -2.0.ltoreq.w<2.0; or

		Co., Ltd.	Abstract
Issued:			An alloy ingot for permanent magnet consists essentially of rare earth metal
January 24,		(Hyogo, JAPAN)	and iron and optionally boron. The two-component alloy ingot contains 90 vol
1995			% or more of crystals having a crystal grain size along a short axis of 0.1 to
			100 .mu.m and that along a long axis of 0.1 to 100 .mu.m. The three-
Expired:			component alloy ingot contains 90 vol % or more of crystals having a crystal
Feb 2013			grain size along a short axis of 0.1 to 50 .mu.m and that along a long axis of
			0.1 to 100 .mu.m. The alloy ingot is produced by solidifying the molten alloy
			uniformly at a cooling rate of 10.degree. to 1000.degree. C./sec. at a sub-
			cooling degree of 10.degree. to 500.degree. C. A permanent magnet and
			anisotropic powders are produced from the alloy ingot.
			1. A method for <i>[process/method]</i> producing an alloy ingot comprising
			melting a rare earth metal-iron alloy to obtain a molten alloy and solidifying
			the molten alloy uniformly at a cooling rate of 10.degree. to 1000.degree.
			C./sec. and at a sub-cooling degree of 10.degree. to 500.degree. C.
			2. The method for producing the alloy ingot as claimed in claim 1 wherein said
			molten alloy is solidified by a strip casting method.
			4. A method for producing an alloy ingot comprising
			melting a rare earth metal-iron alloy to obtain a molten alloy, and
			solidifying the molten alloy uniformly by controlling the cooling rate of said
			molten alloy to be between 10.degree. and 1000.degree. C./sec. and controlling
			the sub-cooling degree of said molten alloy to be between 10.degree. and
			500.degree. C.

20, 1992	General Motors	Abstract
20, 1772	Corporation	A method is provided for forming a high energy product, anisotropic, hot
Issued:	Corporation	pressed iron-rare earth metal permanent magnet without the requirement for
	(Datasit MILICA)	
October 4,	(Detroit, MI USA)	magnetic alignment during pressing or additional hot working steps. The
1994		method of this invention includes providing a quantity of anisotropic iron-rare
		earth metal particles and hot pressing the particles so as to form a substantially
Expired:		anisotropic permanent magnet. The pressed permanent magnet of this
Nov 2012		invention permits a greater variety of shapes as compared to conventional hot
		worked anisotropic permanent magnets. As a result, the magnetic properties
		and shape of the permanent magnet of this invention can be tailored to meet
		the particular needs of a given application.
		The embodiments of the invention in which an exclusive property or privilege
		is claimed are defined as follows:
		1. A method for forming <i>[process/method]</i> a hot pressed iron-rare earth metal permanent magnet, the method comprising the steps of:
		providing platelet-shaped anisotropic iron-rare earth metal particles, wherein
		the anisotropic iron-rare earth metal particles are formed from a composition
		comprising, on an atomic percent basis, about 40 to about 90 percent iron or a
		mixture of cobalt and iron, about 10 to about 40 percent rare earth, and at least
		about 0.5 percent boron; and
		about 0.5 percent boron, and
		hot pressing a quantity of the anisotropic iron-rare earth metal particles in the
		absence of a magnetic alignment field such that the anisotropic iron-rare earth
		metal particles are substantially magnetically nonaligned during the hot
		pressing step, the hot pressing step forming the hot pressed anisotropic iron-
		rare earth metal permanent magnet, the hot pressed iron-rare earth metal
		permanent magnet having platelet-shaped grains and exhibiting a magnetic

anisotropy and an energy product which is greater than that of a hot pressed isotropic magnet having a substantially similar composition, and which is less than that of a hot worked anisotropic magnet having a substantially similar composition;

wherein the hot pressed anisotropic iron-rare earth metal permanent magnet exhibits an energy product of at least about 15 megaGaussOersteds.

10. A method for forming a hot pressed iron-rare earth metal permanent magnet comprising, on a weight percent basis, about 26 to 32 percent rare earth wherein at least about 90 percent of this constituent is neodymium, about 0.7 to about 1.1 percent boron, and the balance being essentially iron, the method comprising the steps of:

melt spinning a hot pressed iron-rare earth metal composition to form overquenched ribbons;

forming isotropic iron-rare earth particles from the ribbons;

hot pressing the isotropic iron-rare earth metal particles to form an isotropic magnet body;

hot working the isotropic magnetic body so as to plastically deform the ironrare earth metal particles of the isotropic magnet body, so as to form an anisotropic magnet body;

comminuting the anisotropic magnet body so as to form platelet-shaped anisotropic iron-rare earth metal particles from the anisotropic magnet body; and

hot pressing a quantity of the anisotropic iron-rare earth metal particles in the

			absence of a magnetic alignment field such that the anisotropic iron-rare earth metal particles are substantially magnetically nonaligned during the hot pressing step, the hot pressing step forming the hot pressed iron-rare earth metal permanent magnet;  whereby the iron-rare earth metal permanent magnet exhibits an energy product of at least about 15 megaGaussOersteds.
Filed: December 3, 1992	5,338,372	Assignee: Hitachi Metals, Ltd.	Anisotropic rare-earth permanent magnets and method for making same, and metal mold for molding anisotropic permanent magnets
			Abstract
Issued: August 16, 1994 Expired: Dec 2012		(Tokyo, JAPAN)	Anisotropic rare-earth permanent magnets characterized in that an aggregate of a plurality of blocks, to each of which anisotropy is imparted, is formed using powders of magnetic material containing rare-earth elements, and the adjoining blocks are powder-metallurgically bonded together under pressure into one piece; a method of making anisotropic rare-earth permanent magnets by molding anisotropic blocks by magnetic-field molding, arranging, aggregating and sealing a plurality of blocks in a bag, and cold hydrostatic pressing the aggregate of blocks in the absence of magnetic field; and a suitable metal mold for magnetic-field molding anisotropic permanent magnets of a relatively large size.
			What is claimed is:  1. A method of manufacturing [process/method] anisotropic rare-earth
			permanent magnets wherein said manufacturing method includes a process of molding powders of permanent magnet materials containing rare-earth elements by means of a metal mold disposed in a magnetic field into an anisotropic block by exerting a molding pressure of more than 0.6 t/cm.sup.2, a process of aggregating and arranging a plurality of said blocks into an

			aggregate having a shape and sealing said aggregate in a bag impermeable to a hydrostatic medium, and a process of cold hydrostatic pressing said aggregate of blocks sealed in said bag in the absence of magnetic field by applying a pressure exceeding said molding pressure.  2. A method of manufacturing [process/method] anisotropic rare-earth permanent magnets, comprising:  employing a metal mold disposed in a magnetic field;  disposing molding powders of permanent magnet materials containing rare-earth elements in said metal mold;  exerting a mold pressure of more than 0.6 t/cm.sup.2 on said permanent magnet materials to form an anisotropic block;  aggregating and arranging a plurality of said anisotropic blocks into an aggregate having a predetermined shape;  sealing said aggregate in a bag impermeable to a hydrostatic medium;
			cold hydrostatically pressing said aggregate of block sealed in said bag in the absence of a magnetic field by applying a pressure exceeding said molding pressure.

Nov 19,		Mitsubishi Metal	magnet
1992		Corporation	Abstract
Issued:		Corporation	There is disclosed a RFeB or RFeCoB alloy permanent magnet
August 16,		(Tokyo, JAPAN)	powder which may contain Ga, Zr or Hf, or may further contain Al, Si or V.
August 10,		(TOKYO, JAI AIN)	powder which may contain Ga, 21 of 111, of may further contain A1, 31 of V.

1994	Each individual particle of the powder includes a structure of recrystallized grains containing a R.sub.2 Fe.sub.14 B or R.sub.2 (Fe,Co).sub.14 B
Expires:	intermetallic compound phase. The intermetallic compound phase has
Aug 2012	recrystallized grains of a tetragonal crystal structure having an average crystal
1105 2012	grain size of 0.05 to 20 .mu.m. At least 50% by volume of the recrystallized
	grains of the aggregated structure are formed so that a ratio of the greatest
	dimension to the smallest dimension is less than 2 for each recrystallized grain.
	In order to manufacture the magnet powder, regenerative material and alloy
	material are prepared and their temperature is elevated in a hydrogen
	atmosphere. Then, the alloy material and the regenerative material are held in
	the same atmosphere at a temperature or 750.degree. C. to 950.degree. C., and
	then held in a vacuum at 750.degree. C. to 950.degree. C., and cooled and
	crushed. A bonded magnet produced using the above magnet powder is also
	disclosed.
	What is claimed is:
	1. A method for producing [process/method] a rare earth iron-boron
	permanent magnet powder comprising the steps of:
	permanent magnet powder comprising the steps of.
	(a) plasma-melting and casting a rare earth alloy material which contains 8 to
	30 atomic percent of at least one rare earth elements, 3 to 15 atomic percent of
	B, and the balance Fe and unavoidable impurities; which may optionally
	include
	0.01 to 40 atomic percent Co;
	0.01 to 5.0 atomic percent of at least one element selected from the group
	consisting of Ga, Al, Si and V; or
	0.01 to 3.0 atomic percent of at least one element selected from the group

			consisting of Zr and Hf;
			(b) adding a regenerative material to the alloy material prepared in step (a) to provide a mixture;
			(c) subsequently elevating the temperature of said alloy material and said regenerative material in a hydrogen atmosphere and holding the same in said atmosphere at a temperature of 750.degree. C. to 950.degree. C. whereby a hydrogenation mixture is produced;
			(d) subsequently dehydrogenating said hydrogenated mixture by exposing said mixture to a temperature of 750.degree. C. to 950.degree. C. in a vacuum, wherein the temperature drop caused by the dehydrogenation of the alloy material is prevented by the regenerative material; and
			(e) subsequently cooling and crushing said alloy.
Filed:	5,314,548	Assignee:	Fine grained anisotropic powder from melt-spun ribbons
e 22, 1992  Issued: May 24, 1994  Expired: June 2012		General Motors Corporation (Detroit, MI USA)	Abstract A method is disclosed for producing a rapidly solidified, fine grained, magnetically anisotropic powder of the RE-Fe-B type. The rapidly solidified material is optimally quenched or slightly overquenched and is subjected to a hydrogen absorption-hydrogen desorption process that produces a fine grained material containing the essential magnetic phase RE.sub.2 TM.sub.14 B and an intergranular phase and is magnetically anisotropic.
			The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:
			1. A method of making <i>[process/method]</i> fine grained, magnetically

Filed	5 300 156	Accionac	anisotropic permanent magnet powder particles consisting essentially of grains of the tetragonal crystal phase RE.sub.2 (Fe.sub.x Co.sub.1-x).sub.14 B.sub.1 with an intergranular phase surrounding the grains, where RE represents one or more rare earth elements including at least 60 percent neodymium and/or praseodymium, the value of x is in the range of 0.6 to 1, and the composition of the intergranular phase is richer in rare earth element content than the tetragonal crystal phase, the composition of said powder being further characterized in that in molten precursor form, it is susceptible to being rapidly cooled to solidification over a determinable and controllable range of cooling rates within which range a series of fine grained crystalline products is formed that respectively display (a) values of magnetic coercivity that continually increase toward a maximum value and decrease from such value as the cooling rate is increased and (b) values of magnetic remanence that increase over at least a part of such range as the cooling rate is increased, said method comprising  rapidly solidifying a said molten precursor composition at a maximum coercivity value cooling rate or greater to form fine-grained particles in which the average grain size is no greater than about 100 nanometers,  heating said rapidly solidified particles in a hydrogen atmosphere at a pressure no greater than atmospheric pressure at a temperature for forming metal hydrides in the particles, and thereafter  removing hydrogen from the particles and cooling the particles to provide said magnetically anisotropic powder, the time and temperature of hydrogen treatment and removal being such that the average grain size of the 2-14-1 phase is no greater than 500 nanometers.

Filed: August 9,	<u>5,147,473</u>	Assignee:	Permanent magnet alloy having improved resistance to oxidation and process for production thereof
1990		Dowa Mining Co., Ltd.	Tot production thereof
			Abstract
Issued: September 15, 1992 Expired: Aug 2010		(Tokyo, JAPAN)	A permanent magnet made of an R-Fe-B-C or R-Fe-Co-B-C based alloy (where R is at least one rare-earth element) consisting of its individual magnetic crystal grains that are covered with an oxidation-resistant protective film is promising as a practicable next-generation magnet because of its having not only excellent magnetic properties inclusive of magnetic force that surpasses Sm-Co based magnets but also such highly improved oxidation resistance that may withstand use in practical applications for a prolonged time period without being coated on its outermost exposed surface with an oxidation-resistant protective film. Said protective film surrounding the individual magnetic crystal grains contains at least one, preferably substantially all, of the alloying elements of which said magnetic crystal grains are made, with 0.05-16 wt. %, preferably 0.1-16 wt. % of said protective film being composed of C.
			What is claimed is:
			1. A permanent magnet alloy <i>[composition of matter]</i> which is based on a R-Fe-B-C system, R being at least one of the rare-earth elements including Y, comprising individual magnetic crystal grains having a particle size of 0.3-150 .mu.m and which are covered with an oxidation-resistant protective film, with 0.05-16 wt % of said protective film comprising C, and the composition of said magnet alloy as the sum of the magnetic crystal grains and the oxidation-resistant protective film comprising 10-30% R, less than 2%, not inclusive of zero percent, of B, 0.1-20% C, all percentages being on an atomic basis, with

			the balance being Fe and incidental impurities.
			2. The permanent magnet alloy according to claim 1 wherein said magnetic crystal grains have a particle size of 0.5-50 .mu.m.
			3. The permanent magnet alloy according to claim 2, wherein the rare-earth element is Nd; said oxidation-resistant protective film has a thickness of 0.001-15 .mu.m.
			28. In an improved permanent magnet <i>[composition of matter]</i> made of a R-Fe-B-C system alloy, R being at least one of the rare-earth elements including Y, the improvement comprising said alloy comprising individual magnetic crystal grains having a particle size of 0.3-150 .mu.m and which are covered with an oxidation-resistant protective film, with 0.05-16 wt % of said protective film comprising C, the composition of said magnet alloy as the sum of the magnetic crystal grains and the oxidation-resistant protective film comprising 10-30% R, less than 2%, not inclusive of zero percent, of B, 0.1-20% C, all percentages being on an atomic basis, with the balance being Fe and incidental impurities.
Filed:	5,096,512	Assignee:	Magnetic materials and permanent magnets
y 26, 1988  Issued: March 17, 1992  Expired: March 2009		Sumitomo Special Metals Co., Ltd. (Osaka, JAPAN)	Abstract Magnetic materials comprising Fe, B and R (rare earth elements) having a major phase of an Fe-B-R intermetallic compound which may be a tetragonal system, wherein at least 50 at % of R consists of Nd and/or Pr, and anisotropic sintered permanent magnets consisting essentially of 8-30 at % R, 2028 at %, B and the balance being Fe with impurities. These magnetic materials and permanent magnets may contain additional elements M (Ti, Ni, Bi, V, Nb, Ta, Cr, Mo, W, Mn, Al, Sb, Ge, Sn, Zr, Hf), thus providing Fe-B-R-M type materials and magnets.

			We claim:
			1. A crystalline permanent magnet alloy <i>[composition of matter]</i> in which the major phase is an Fe-B-R compound wherein R is one or two of Nd and Pr, said compound being stable at room temperature or above, having a Curie temperature higher than room temperature and having magnetic anisotropy, the alloy consisting essentially of, by atomic percent of the entire alloy, 8-30 percent R, 2-28 percent B and the balance being at least 42 percent Fe.
			2. A crystalline permanent magnet alloy <i>[composition of matter]</i> comprising a major phase of an Fe-B-R compoud wherein R is at least one of Nd, Pr, Dy, Ho, Tb, La, Ce, Gd and Y, and wherein at least 50 atomic percent of R consists of Nd and/or Pr, said compound being stable at room temperature or above, having a Curie temperature higher than room temperature and having magnetic anisotropy, the alloy consisting essentially of, by atomic percent of the entire alloy, 8-30 percent R, 2-28 percent B and the balance being at least 42 percent Fe.
Filed:	5,089,060	Assignee:	Thermomagnetically patterned magnets and method of making same
September 28, 1990  Issued: February 18, 1992  Expired: Sept 2010		General Motors Corporation (Detroit, MI USA)	Abstract A permanent magnet is heated in a pattern by a laser beam to a localized temperature above the Curie point or a temperature sufficient to reduce the magnet coercivity sufficiently for the field of the magnet or an external field to remagnetize the pattern in the reverse direction. Magnets so produced can have very high pole density, digital encoding and analog patterns having gradually varying local field strength.
			The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:

			,
			1. A method of imparting a magnetic pattern [process/method] to a magnetized bulk permanent magnet material comprising the steps of:
			directing energy in a pattern onto base permanent magnet bulk material to heat a volume of the material to a threshold temperature to lower the coercivity thereof;
			imposing a magnetic field on the heated pattern greater than the coercivity of the heated volume, wherein the field imposed on the heated pattern emanates at least partially from the magnetized base material, whereby the treated pattern generates a lower flux density than the base material; and
			allowing the material to cool in the imposed field, whereby the treated pattern has a magnetic characteristic sufficiently different from the base material to be readily detected by a magnetic sensor.
			2. The invention as defined in claim 1 wherein the magnetic field imposed on the pattern emanates solely from the magnetized base material.
			3. The invention as defined in claim 1 wherein the step of imposing a magnetic field on the heated pattern includes the step of establishing an external magnetic field in opposition to the field of the base material so that the magnetic field imposed on the pattern emanates partially from the magnetized base material and partially from the external magnetic field.

January 26,			
1990		Kabushiki Kaisha	Abstract
Issued:		Toshiba	There is disclosed a permanent magnet comprising a sintered alloy composed of rare earth elements (R), boron and iron. This permanent magnet is

December	(Kawasaki, JAPAN)	substantially constituted by 2-phase systems, i.e. a ferromagnetic Fe-rich phase
10, 1991		(Nd.sub.2 Fe.sub.14 B) and a nonmagnetic R-rich phase (Nd.sub.97 Fe.sub.3),
		and has BH.sub.max of more than 38.0 MGOe. The rare earth-iron-boron-
Expired:		based permanent magnet of this invention is a substantially only 2-phase
Jan 2010		system, composed of a tetragonal ferromagnetic Fe-rich phase of intermetallic
		Nd.sub.2 Fe.sub.14 B compound and a cubic nonmagnetic R-rich phase having
		R value of over 90%, for example, Nd.sub.97 Fe.sub.3. Namely, the rare earth-
		iron-boron based permanent magnet of the present invention has a tetragonal system substantially free from a tetragonal R-rich phase (Nd.sub.2 Fe.sub.7
		B.sub.6). This also applies to the case where the R component is formed of any
		other rare earth elements than Nd.
		other rate cutth elements than rea.
		What is claimed is:
		1. A permanent magnet formed of a sintered alloy, comprising [composition of
		matter]:
		(i) 10 to 40% by weight of at least one metal element selected from the group
		consisting of the rare earth elements (R) and yttrium,
		(ii) 0.8 to 1.1% by weight boron and
		(iii) the balance iron, wherein said sintered alloy consists essentially of a ferromagnetic Fe-rich phase as the main phase, 2.5 to 5.0% by volume of a R-
		rich phase and less than 1% by volume of a B-rich phase, said alloy having a
		maximum energy product (BH.sub.max) of at least 38.0 MGOe.
		The second secon
		21. A permanent magnet having a maximum energy product (BH.sub.max) of
		at least 38.0 MGOe, comprising at least 96.5% by volume of a ferromagnetic
		Fe-rich phase as the main phase, at least 2.5% by volume of an R-rich phase
		and less than 1% by volume of a B-rich phase, manufactured by a process
		[process/method] comprising the steps of:

			<ul> <li>(i) preparing an alloy consisting essentially of about 10-40% by weight of R, about 0.8 to 1.1% by weight of boron with the balance being iron, wherein R is at least one element selected from the group consisting of yttrium and the rare earth elements;</li> <li>(ii) pulverizing the alloy into a powder;</li> <li>(iii) molding said powder in a magnetic field thereby obtaining a molded mass; and</li> <li>(iv) sintering the molded mass at a temperature of about 1000.degree1200.degree. C. in an atmosphere of 5.times.10.sup1 Torr or less to obtain said permanent magnet.</li> </ul>
Filed: August 12, 1985  Issued: October 15, 1991  Expired: Oct 2008	5,056,585	Assignee: General Motors Corporation (Detroit, MI USA)	High energy product rare earth-iron magnet alloys  Abstract  Magnetically hard compositions having high values of coercivity, remanence and energy product contain rare earth elements, transition metal elements and boron in suitable proportions. The preferred rare earth elements are neodymium and praseodymium, and the preferred transition metal element is iron. The magnetic alloys have characteristic very finely crystalline microstructures. This invention relates to making improved magnetically hard rare earth-transition metal compositions by incorporating small amounts of the element boron and quenching molten mixtures of the constituents at a rate between that which yields an amorphous magnetically soft material or a magnetically soft crystalline material.  The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:

1. A method of making a composition *[process/method]* having permanent magnet properties at room temperature comprising

preparing a melt of a composition comprising, on an atomic percentage basis of the total composition, 0.5 to 10 percent boron, 10 to 50 percent of one or more rare earth elements where neodymium or praseodymium or a mixture thereof constitutes at least 60 percent of the total rare earth element content, and one or more transition metal elements taken from the group consisting of iron and mixtures of iron and cobalt where iron constitutes at least 60 percent of the total transition metal, such molten composition being susceptible to being rapidly cooled to solidification over a determinable and controllable range of cooling rates within which range a series of fine grained crystalline products are formed that respectively display (a) values of magnetic coercivity that continually increase toward a maximum value and decrease from such value as the cooling rate is increased, and (b) values of magnetic remanence that increase over at least a part of such range as the cooling rate is increased, and

continually rapidly cooling portions of the melt by ejecting them onto a moving quench surface to form a fine grained crystalline product while controlling the cooling rate within said cooling range by a method comprising controlling the rate of movement of such surface such that the product has a desired combination of magnetic coercivity and remanence.

2. A method for making a composition *[process/method]* having permanent magnet properties at room temperature in accordance with claim 1 where the melt is rapidly cooled by continually expressing a portion of the melt through an orifice onto a quench surface of a spinning wheel and the cooling rate is controlled by a method comprising controlling the velocity of the quench surface of the spinning wheel to form a fine grained product having an average crystal size in the range of 20 to 400 nm.

## We claim:

- 1. A sintered permanent magnetic material, said sintered permanent magnetic material having been prepared from *[composition of matter]* a compacted metallic powder having a particle size of 0.3-80 microns and a composition consisting essentially of by atomic percent, 12.5-20% R wherein R is at least one rare earth element including Y and at least 50% of R consists of Nd and/or Pr, 4-20% B, and the balance being at least 60% Fe wherein Co is substituted for Fe in an amount of more than zero and no more than 35 atomic % of the entire material provided that Fe is present in the amount of at least 40% and wherein the sintered permanent magnetic material has a maximum energy product of at least 20 MGOe and has a density which is at least 95% of the theoretical density of the material.
- 2. A sintered permanent magnetic material, said sintered permanent magnetic material having been prepared from a compacted metallic powder having a particle size of 0.3-8 microns and a composition *[composition of matter]* consisting essentially of by atomic percent, 12.5-20% R wherein R is at least one rare earth element including Y and at least 50% of R consists of Nd and/or Pr, 4-20% B, at least one of additional elements M in amount(s) not exceeding the values by atomic percent as specified hereinbelow provided that, when two or more elements M are added, the total amount thereof shall not exceed the largest value among said specified values of the elements actually added: 3.0% Ti, 6.5% Ni, 5.0%

Bi,5.3% V, 9.0% Nb, 7.0% Ta,4.7% Cr, 5.2% Mo, 5.0% W,6.0% Mn, 5.2%

Al, 1.0% Sb,3.5% Ge, 1.5% Sn, 3.2% Zr, and3.2% Hf.

and the balance being at least 60% Fe wherein Co is substituted for Fe in an amount of more than zero and no more than 35 atomic % of the entire material provided that Fe is present in an amount of at least 40% and wherein the sintered permanent magnetic material has a maximum energy product of at least 20 MGOe and has a density which is at least 95% of the theoretical

			density of the material.
Filed: No v 22, 1988  Issued: November 6, 1990  Expired: Nov 2007	4,968,347	Assignee: The United States of America (Washington, DC USA) under, Contract No. DE-AC03-76SF00098 between the United States Department of Energy and the University of California	High energy product permanent magnet having improved intrinsic coercivity and method of making same  Abstract A high energy rare earth-ferromagnetic metal permanent magnet is disclosed which is characterized by improved intrinsic coercivity and is made by forming a particulate mixture of a permanent magnet alloy comprising one or more rare earth elements and one or more ferromagnetic metals and forming a second particulate mixture of a sintering alloy consisting essentially of 92-98 wt. % of one or more rare earth elements selected from the class consisting of Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, and mixtures of two or more of such rare earth elements, and 2-8 wt. % of one or more alloying metals selected from the class consisting of Al, Nb, Zr, V, Ta, Mo, and mixtures of two or more of such metals. The permanent magnet alloy particles and sintering aid alloy are mixed together and magnetically oriented by immersing the mixture in an axially aligned magnetic field while cold pressing the mixture. The compressed mixture is then sintered at a temperature above the melting point of the sintering aid and below the melting point of the permanent magnet alloy to thereby coat the particle surfaces of the permanent magnetic alloy particles with the sintering aid while inhibiting migration of the rare earth element in the sintering aid into the permanent magnet alloy particles to thereby raise the intrinsic coercivity of the permanent magnet alloy without substantially lowering the high energy of the permanent magnet alloy.  What is claimed is:
			1. A method of making <i>[process/method]</i> a high energy permanent magnet characterized by improved intrinsic coercivity which comprises:

- (a) forming a particulate mixture of a permanent magnet alloy comprising one or more rare earth elements and one or more ferromagnetic metals;
- (b) forming a particulate mixture of a sintering alloy consisting essentially of:
- (i) 92-98 wt.% of one or more rare earth elements selected from the class consisting of Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, and mixtures of two or more of such rare earth elements, and;
- (ii) 2-8 wt.% of one or more alloying metals selected from the class consisting of Al, Nb, Zr, V, Ta, Mo, and mixtures of two or more of such metals;
- (c) forming a particulate mixture of said particulate permanent magnet alloy and said particulate sintering aid alloy;
- (d) magnetically orienting said particulate mixture by immersing the mixture in an axially aligned magnetic field; and
- (e) sintering the magnetically aligned particulate mixture at a temperature above the melting point of said sintering aid and below the melting point of said permanent magnet alloy;
- to thereby coat the particle surfaces of said permanent magnetic alloy particles with said sintering aid while inhibiting migration of the rare earth element in said sintering aid into said permanent magnet alloy particles to thereby raise the intrinsic coercivity of said permanent magnet alloy without substantially lowering the high energy of said permanent magnet alloy.
- 2. The method of *[process/method]* claim 1 wherein said step of forming a particulate mixture of said particulate permanent magnet alloy and said particulate sintering aid alloy further comprises mixing together from about 92

			to about 99 wt.% permanent magnet alloy and from about 1 to about 8 wt.% of said sintering aid alloy.
